[Submitting Counsel on Signature Page]

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF CALIFORNIA
SAN FRANCISCO DIVISION

IN RE: JUUL LABS, INC. MARKETING,
SALES PRACTICES, AND PRODUCTS
LIABILITY LITIGATION

MDL No. 19-md-2913

THIS DOCUMENT RELATES TO:
*Menifee County Public Schools, By and Through
The Menifee County Board of Education v. JUUL
Labs, Inc.*

PLAINTIFF’S COMPLAINT

JURY TRIAL DEMANDED

COMPLAINT

1
2 Plaintiff, Menifee County Public Schools, by and through the Menifee County Board of
3 Education (“Plaintiff” or “Menifee Public Schools”), by and through its attorneys, respectfully
4 submits this Complaint against Defendant Juul Labs, Inc. (hereinafter “JUUL”). Plaintiff alleges
5 the following upon personal knowledge as to itself and its own acts, and upon information and
6 belief as to all other matters based on the investigation of counsel.
7

I. NATURE OF THE CASE

8
9 1. Nicotine is one of the most toxic of all poisons.¹ Nicotine is also one of the most
10 addicting agents. The US surgeon general has concluded nicotine to be as addictive as cocaine or heroin.
11 Nicotine interacts with the nicotinic acetyl choline receptors and stimulates the dopaminergic
12 transmission.² This in turn stimulates the reward center and is responsible for the mood elevation and
13 apparent improvement in cognitive function.³ With chronic stimulation by nicotine the GABAergic
14 neurons are desensitized and thus lose their inhibitory effect on dopamine.⁴ This in turn reinforces the
15 addiction by inducing craving. This effect has been shown to affect the CYP2A6 gene and leads to
16 heritable dependence to nicotine. Studies have shown the nicotine dependence to be transmitted
17 maternally and grand maternally by epigenetic mechanism.⁵
18

19
20 2. Nicotine poses several health hazards. There is an increased risk of cardiovascular,
21

22 ¹ Mishra, A., et al., Indian J Med Paediatr Oncol. 2015 Jan-Mar; 36(1): 24–31. doi: 10.4103/0971-5851.151771

27 ⁵ Leslie FM. Multigenerational epigenetic effects of nicotine on lung function. BMC Med. 2013;11:27. [PMC free article] [PubMed] [Google Scholar]
28

1 respiratory, gastrointestinal disorders. There is decreased immune response and it also poses ill impacts
2 on the reproductive health. It affects the cell proliferation, oxidative stress, apoptosis, DNA mutation
3 by various mechanisms which leads to cancer. It also affects the tumor proliferation and metastasis and
4 causes resistance to chemo and radio therapeutic agents. The use of nicotine needs regulation. The sale
5 of nicotine should be under supervision of trained medical personnel.
6

7 3. Nicotine marketing has continually developed new techniques in response to historical
8 circumstances, societal and technological change, and regulation. For decades humans were exposed
9 to the harms of nicotine through cigarettes. Cigarette manufacturers managed to effectively market their
10 products, despite the obvious health hazards, in two ways: by creating “healthier alternatives” and
11 marketing to young people.
12

13 4. The nicotine industry promoted "modified risk" nicotine products, falsely implied to
14 be less harmful, such as roasted, "filter", menthol, and ventilated ("light") cigarettes. These products
15 were used to discourage quitting, by offering unwilling smokers an alternative to quitting, and implying
16 that using the alternate product would reduce the hazards of smoking. "Modified risk" products also
17 attract new smokers. It is now known that these products are not less harmful. Filter cigarettes became
18 near-universal, but smokers suffered just as much illness and death.
19

20 5. Cigarette manufacturers also knew that teenagers were more susceptible to becoming
21 addicted to nicotine. And if you could addict a 14-year old to smoking, you gained a customer for
22 decades, if they lived that long. Through studies once concealed but later made public, and countless
23 deaths, Americans learned that smoking traditional cigarettes was highly addictive and posed serious,
24 often fatal, health hazards. Fortunately, cigarette smoking has been on the decline.
25

26 6. Though not alone in pursuing development of electronic cigarettes, JUUL did so by
27 using both strategies. Taking a page from big tobacco’s playbook, JUUL, in concert with its advertising
28

1 agencies and others, developed a product and marketing strategy that sought to portray its e-cigarette
2 products as trend-setting, stylish and used by the type of people teenagers look up to, and one that was
3 a healthy alternative to traditional tobacco use. In addition to advertisements eerily similar in scheme
4 and content to those of traditional cigarette manufacturers, JUUL utilized social media extensively,
5 knowing full well that teenagers are the primary users of social media. In particular, JUUL enlisted the
6 services of social media “influencers”—social media personalities with large followings—to
7 surreptitiously promote JUUL’s products (“Social Media Influencers”). Similarly, JUUL developed an
8 “affiliate program” whereby it paid third parties (“JUUL Affiliates”) to refer would-be customers to
9 JUUL’s website. JUUL forbid the JUUL Affiliates from disclosing their affiliation with JUUL.
10

11 7. JUUL also mined the middle and high school environments for new customers for life,
12 by expending significant resources marketing directly to students. Through “education” programs at
13 schools, JUUL employees and agents sought to raise awareness of JUUL’s flavored, low-irritation
14 nicotine products among students. JUUL used both its own employees and hired consultants to speak
15 to students. It appears JUUL went so far as to sponsor a summer camp for kids, paying \$134,000. As
16 part of that sponsorship, JUUL would receive data on the camp’s participants: kids ranging from grade
17 3 to 12. What JUUL needed data regarding 3rd graders for is known only to JUUL, but the possibilities
18 are frightening.
19

20 8. In addition to a product design that aesthetically appeals to youth and marketing
21 tactics now banned for manufacturers of combustible cigarettes, JUUL has, since its product launch
22 in 2015, misrepresented material facts regarding JUUL’s products and their effects on users. In
23 particular, JUUL misrepresents the amount of nicotine a JUUL device delivers to a user’s
24 bloodstream and the increased risk of nicotine addiction and other severe health consequences the
25
26
27
28

1 higher-than-disclosed nicotine levels present. JUUL successfully created a misleading impression
2 that JUUL products were intended for youth and healthy.

3 9. As a result of JUUL's youth-targeted product design and marketing, and years of
4 misstatements and omissions regarding its products, JUUL succeeded in addicting a generation of youth
5 to nicotine. Nicotine use amongst America's youth is sharply on the rise. Parents, teachers, health care
6 practitioners and the U.S. Government are combatting the meteoric rise of vaping amongst teens. E-
7 cigarette use in general increased 78% among high-school students and 48% among middle-school
8 students from 2017 to 2018. The U.S. Food and Drug Administration ("FDA") Commissioner called
9 these results "astonishing." The Secretary of the U.S. Department of Health and Human Services, Alex
10 Azar, recently stated at a press conference: "We have never seen use of any substance by America's
11 young people rise as rapidly as e-cigarette use is rising."
12

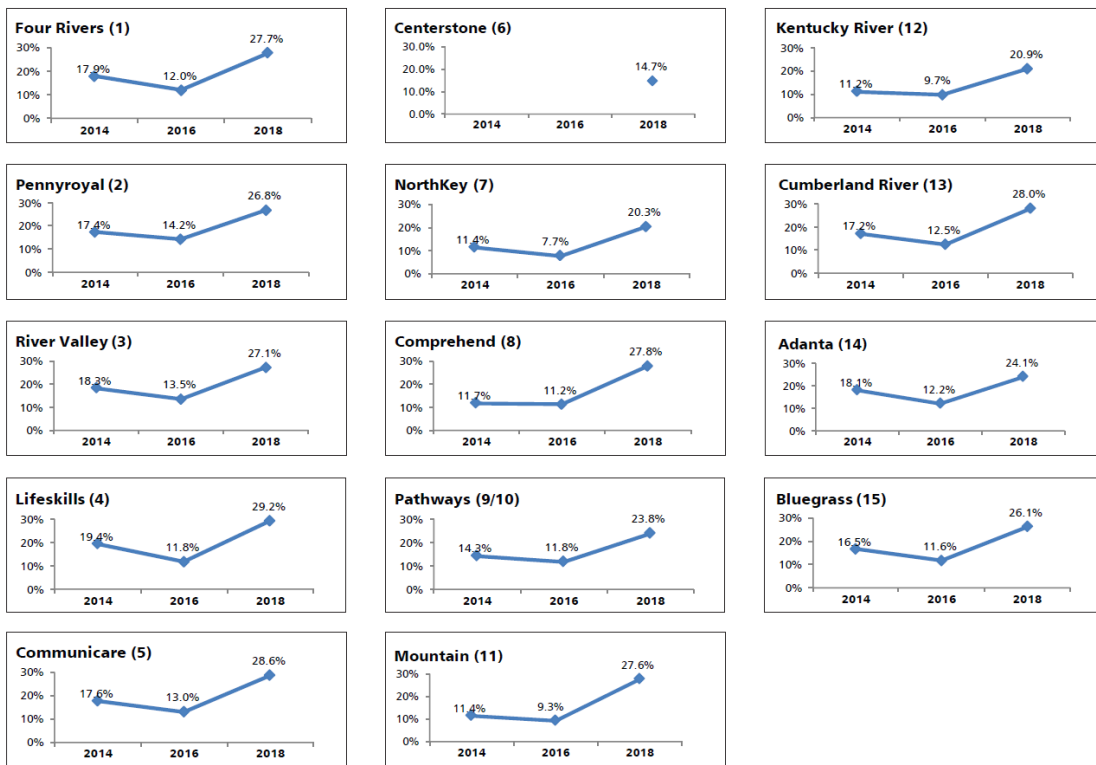

13
14 10. Vaping is now an epidemic in the Commonwealth of Kentucky. The Kentucky
15 Department for Public Health released a statement on October 8, 2019 urging all Kentuckians to
16 discontinue use of all e-cigarette and vaping products. "It is of critical importance that we keep these
17 devices out of the hands of young people. While we already know the negative outcomes of smoking,
18 the short and long term effects of e-cigarettes is relatively unknown," said Adam Meier, Secretary of
19 the Cabinet for Health and Family Services. "What we do know is that these products contain nicotine,
20 often at high levels, which is highly addictive and habit-forming, and may lead to a lifetime of use.
21

22 11. School districts in Kentucky have been uniquely and disproportionately impacted by
23 JUUL's conduct. Educators are being forced to expend significant resources to combat JUUL use by
24 students. JUUL use by students during school presents both a danger to students and increases the
25 resources necessary to educate the students who use JUUL. It also detracts from educators' limited time
26 and resources to educate their student population generally. Schools have installed sensors in
27
28

1 bathrooms, removed bathroom doors, and banned USB flash drives, to name just a few of the steps
 2 taken. More action is needed.

3 12. Data collected in the Kentucky Incentives for Prevention (KIP) Survey demonstrate
 4 that the marketing efforts of the Defendant have simultaneously increased usage of e-cigarettes among
 5 students in Kentucky and decreased the recognition of the risks associated with nicotine addiction
 6 caused by e-cigarettes. The KIP data shows that in 2018 while 72.1% of 12th grade students in
 7 Kentucky recognized the risk of harm from smoking cigarettes, only 39.1% of those same students
 8 appreciate risks associated with the use of e-cigarettes. Between 2014 and 2018, the usage of e-
 9 cigarettes among 10th graders increased across all regions of Kentucky by 50-75%, and in some cases
 10 the increase in that time period was as much as 250%.
 11
 12

13 Regional Trends—**Electronic Cigarettes, 30-Day Use** by 10th Graders, 2014-2018
 14 (*% responding that they had used the substance on at least one day in the past 30 days*)

25 13. JUUL’s tortious and illegal conduct has given rise to an epidemic of vaping across
 26
 27
 28

1 America and within Plaintiff's School District. Plaintiff has been forced to expend significant resources
2 combatting this public nuisance of Defendant's creation and will need to continue expending such
3 resources as the epidemic shows no signs of abating on its own.

4 14. This action seeks to hold JUUL and others who acted in concert and independently
5 towards the same goal accountable for their tortious and illegal conduct, including the creation and
6 maintenance of a public nuisance resulting in past, present, and ongoing harm to Plaintiff.
7

8 **II. PARTIES**

9 15. Plaintiff Menifee County Public Schools serves over 900 students in four schools.
10 Menifee County Public Schools' offices are located at 202 Back Street, Frenchburg, KY 40322.
11 Menifee County Public Schools brings this suit by and through the Plaintiff Menifee County Board of
12 Education, which is a citizen of Kentucky and vested with the authority to bring suit on behalf of the
13 school district pursuant to K.R.S. §160.106 and §160.290.
14

15 16. Defendant JUUL Labs, Inc. is a Delaware corporation, having its principal place of
16 business in San Francisco, California. JUUL Labs, Inc. originally operated under the name PAX Labs,
17 Inc. In 2017, it was renamed Juul Labs, Inc. JUUL Labs, Inc. manufactures, designs, sells, markets,
18 promotes and distributes JUUL e-cigarettes and JUULpods.
19

20 **III. JURISDICTION AND VENUE**

21 17. This case is being directly filed into this Court pursuant to CMO3 allowing for direct
22 filing of cases that would be subject to transfer.
23

24 18. This Court has jurisdiction over the matter of this action pursuant to 28 U.S.C. §
25 1332(a). The amount in controversy exceeds \$75,000 exclusive of interest and costs, and this is an
26 action by a Plaintiff against Defendant who are each citizens of different states.
27
28

1 19. This Court has supplemental jurisdiction over the state law claims pursuant to 28
2 U.S.C. § 1367.

3 20. Upon remand, the Eastern District of Kentucky will have personal jurisdiction over
4 Plaintiff because Plaintiff resides in Menifee County and is a citizen of the State of Kentucky.

5 21. Upon remand, the Eastern District of Kentucky will have personal jurisdiction over
6 Defendant because they do business in the Eastern District of Kentucky and have sufficient minimum
7 contacts with the Eastern District of Kentucky. Defendant intentionally avail themselves of the markets
8 through the promotion, marketing, and sale of the products at issue in this lawsuit to render the exercise
9 of jurisdiction by this Court permissible under Kentucky law and the U.S. Constitution. Furthermore,
10 a substantial part of the events giving rise to the claims occurred in this judicial district.
11

12 22. Upon remand, the Eastern District of Kentucky will have venue pursuant to 28 U.S.C.
13 § 1391(b)(2) because a substantial part of the events giving rise to the claims occurred in that judicial
14 district.
15

16 **IV. FACTUAL ALLEGATIONS**

17 **A. JUUL is Created to Bring Tobacco Use to a New Level of Accessibility**

18 23. In 2004, Adam Bowen and James Monsees were graduate students pursuing master's
19 degrees in product design at Stanford. Both were smokers at the time. One night, during a smoke
20 break, an idea was born for the pair's thesis presentation. After interviewing fellow smokers on what
21 they liked and disliked about smoking traditional combustible cigarettes, Bowen and Monsees
22 presented on, what they called, "the national future of smoking." That presentation would ultimately
23 lead to the formation of JUUL and the pair's now multi-billion- dollar success in the e-cigarette and
24 vaping industry. Bowen and Monsees are Chief Technology Officer and Chief Product Officer,
25 respectively, at JUUL.
26
27
28

1 24. In later discussing his motivations behind developing vaporizers and e-cigarettes,
2 Monsees said he felt there was a “large opportunity for technology to ... *deliver solutions that refresh*
3 *the magic and luxury of the tobacco category.*” Monsees saw opportunity “for products that speak
4 directly to those consumers who aren’t perfectly aligned with traditional tobacco products,” *i.e.*,
5 consumers who were not current smokers. The goal was to “recreate the ritual and elegance that
6 smoking once exemplified [and] remove tobacco’s social stigma and public adversity while *bringing*
7 *tobacco use to a new level of accessibility.*” Monsees saw the development of “great new offerings in
8 the tobacco space” as “new experiences that preserve the wonder and elegance of smoking.” “As
9 smokers, [Bowen and Monsees] knew a true alternative to cigarettes would have to *offer a nicotine*
10 *level found in no other alternative on the market.*”
11

12 25. Bowen and Monsees founded Ploom in 2007, then sold the Ploom name to Japan
13 Tobacco Inc.—the world’s third largest tobacco company—in 2015. The pair renamed their company
14 PAX Labs Inc. In 2017, the company was renamed JUUL Labs, Inc.
15

16 26. From inception, JUUL has exploited regulatory inaction to design, manufacture,
17 market, and sell highly-addictive nicotine products to youth through a youth-oriented marketing
18 campaign and a parade of misstatements and omissions.
19

20 **B. REGULATORY LANDSCAPE FOR E-CIGARETTES**

21 27. In 2009, the Federal Food, Drug, and Cosmetic Act was amended by the Family
22 Smoking Prevention and Tobacco Control Act (“Tobacco Control Act”). That amendment brought
23 oversight of the manufacture, marketing, distribution, and sale of cigarettes, cigarette tobacco, roll-
24 your-own tobacco, and smokeless tobacco products within the FDA’s purview. The Tobacco Control
25 Act also gave the FDA the authority to “deem” other “tobacco products” within its authority.
26

27 28. In May 2016, the FDA issued a final deeming rule that, among other products, deemed
28

1 electronic nicotine delivery systems (“ENDS”), which includes e-cigarettes, subject to the FDA’s
2 regulatory authority. That rule took effect on August 8, 2016. At that time, years of regulatory and
3 legislative requirements that had been in place for cigarettes became applicable to e-cigarettes. Those
4 regulations included, among other things, that new tobacco products be marketed only after FDA
5 review.
6

7 29. However, as acting director of the FDA Dr. Norman Sharpless recently testified:

8
9 FDA’s initial compliance policy for premarket review stated that the
10 Agency did not intend to enforce the requirements of premarket review against
11 manufacturers of newly-regulated new tobacco products that were on the market
12 as of August 8, 2016, as long as they submitted applications seeking marketing
13 authorization within specific timeframes. As a result, FDA anticipated that many
14 ENDS products would remain on the market without premarket authorization for
15 up to three years.

16
17 30. The FDA gave JUUL and other e-cigarette manufacturers until 2022 to submit a
18 premarket tobacco application (“PMTA”). After public health and medical groups, including the
19 American Academy of Pediatrics, filed suit, Judge Grimm in the United States District Court for the
20 District of Maryland ordered the FDA move up the deadline to May 2020.

21 31. JUUL has not submitted a PMTA for its e-cigarettes or JUULpods. Because federal
22 regulation requires FDA approval prior to the marketing of any e-cigarette, as Dr. Sharpless recently
23 testified: “All ENDS products currently on the market are illegal. They have not been reviewed by the
24 FDA.”
25

26 **C. E-CIGARETTE USE PRESENTS SEVERE PHYSICAL AND**
27 **MENTAL HEALTH RISKS, PARTICULARLY TO YOUTH**
28

1
2 32. All leading health authorities support the three major conclusions of a 1988 report by
3 the Surgeon General of the United States regarding nicotine and tobacco:

- 4 a. Cigarettes and other forms of tobacco are addictive;
5
6 b. Nicotine is the drug in tobacco that causes addiction; and
7
8 c. The physiological and behavioral processes that determine tobacco
9 addiction are similar to those that determine heroin and cocaine
10 addiction.

11 33. Nicotine fosters addiction through the brain's "reward" pathway. A stimulant and a
12 relaxant, nicotine affects the central nervous system; increases blood pressure, pulse, and metabolic
13 rate; constricts blood vessels of the heart and skin and causes muscle relaxation. When nicotine is
14 inhaled it enters the bloodstream through membranes in the mouth and upper respiratory tract and
15 through the lungs. Once nicotine in the bloodstream reaches the brain, it binds to receptors, triggering
16 a series of physiologic effects in the user that are perceived as a "buzz" that includes pleasure,
17 happiness, arousal, and relaxation of stress and anxiety. These effects are caused by the release of
18 dopamine, acetylcholine, epinephrine, norepinephrine, vasopressin, serotonin, and beta endorphin.
19 With regular nicotine use, however, these feelings diminish and the user must consume increasing
20 amounts of nicotine to achieve the same pleasurable effects.⁶

21 34. The neurological changes caused by nicotine create addiction. Repeated exposure to
22 nicotine causes neurons in the brain to adapt to the action of the drug and return brain function to
23

24
25

27 *Annu. Rev. Pharmacol. Toxicol.* 49: 57–71 (2009), available at
28 www.ncbi.nlm.nih.gov/pmc/articles/PMC2946180/.

1 normal. This process, called neuroadaptation, leads to the development of tolerance in which a given
2 level of nicotine begins to have less of an effect on the user.⁷

3 35. Once a brain is addicted to nicotine, the absence of nicotine causes compulsive drug-
4 seeking behavior, which, if not satisfied, results in withdrawal symptoms including anxiety, tension,
5 depression, irritability, difficulty in concentrating, disorientation, increased eating, restlessness,
6 headaches, sweating, insomnia, heart palpitations and tremors – and intense cravings for nicotine.
7 Though smokers commonly report pleasure and reduced anger, tension, depression and stress after
8 smoking a cigarette, many of these effects are actually due to the relief of unpleasant withdrawal
9 symptoms that occur when a person stops smoking and deprives the brain and body of nicotine. Studies
10 have found that most smokers do not like smoking most of the time but do so to avoid withdrawal
11 symptoms.⁸

12 36. JUUL e-cigarettes and JUUL pods deliver toxins and carcinogens that are dangerous
13 to their users. Those dangers are particularly pronounced for teenage users. As former FDA
14 Commissioner David Kessler aptly put it: “A long and tragic history has taught us that nicotine
15 addiction often begins as a pediatric disease.” One peer-reviewed study found that “[y]oung adults who
16 use electronic cigarettes are more than four times as likely to begin smoking tobacco cigarettes within
17 18 months as their peers who do not vape.”⁹

18 37. Nicotine is a toxic chemical associated with cardiovascular, reproductive, and
19

1 immunosuppressive problems. Nicotine adversely affects the heart, eyes, reproductive system, lungs,
2 and kidneys. Exposure to nicotine produces an increased risk of Coronary Vascular Disease by
3 producing acute myocardial ischemia, as well as an increased risk of peripheral arterial disorders.
4

5 38. Research has also shown that e-cigarette users are at an increased risk of strokes and
6 heart attacks,¹⁰ including blood pressure and arterial stiffness, which increases the risk for strokes and
7 heart attacks.¹¹ Other than its use as a stimulant, nicotine's only other known use is as an insecticide.¹²
8 And it has been banned as a pesticide in the U.S. since 2014.¹³

9 39. Nicotine exposure during adolescence is associated with "deficits in working memory,
10 attention, and auditory processing, as well as increased impulsivity and anxiety [and] increase[ed]
11 addiction liability for other drugs."¹⁴ The same research paper noted:

1 Peters et al. examined neural responses to anticipation of financial reward in
2 adolescent smokers (age 14 years) and found that they had smaller neural responses
3 in the ventral striatum and midbrain compared to matched non-smoking controls.
4 Moreover, the reduced response showed a clear-cut relationship with the frequency of
5 smoking. These findings suggest that adolescent smokers display a hypo-responsivity
6 to the anticipation of non-drug reward (i.e., financial reward) relative to non-smokers,
7 and this hypo-responsivity becomes more severe with increased smoking. There is
8 also evidence that adolescents who smoke ≤ 5 cigarettes per day display attenuated
9 responses to other non-drug rewards, including pleasurable food images, relative to
10 non-smokers, in areas including the insula and inferior frontal region. ***The implication
11 of both these studies is that the use of extremely rewarding drugs, such as nicotine,
12 may decrease the perception of the pleasure obtained from non-drug rewards.
13 Furthermore, the fact that this was demonstrated in young- and light-smoking teens
14 indicates that such changes in the brain occur in early phases of smoking.***¹⁵

15 40. Additional evidence suggests that nicotine can affect an adolescent's neurological
16 development and that adolescents are more vulnerable to nicotine addiction.¹⁶ “[N]icotine exposure
17 during vulnerable periods of brain and lung development can have lasting detrimental effects....”¹⁷ In
18 particular, “[s]moking cigarettes during adolescence has been associated with lasting cognitive and
19 behavioral impairments, including effects on working memory and attention and reduced prefrontal
20 cortex activation....”¹⁸ There is “compelling ... evidence that nicotine exposure during adolescent
21 causes both long-term structural and functional changes in the brain.”¹⁹

22 41. JUUL's defective design also puts e-cigarette users, particularly adolescents or young
23 adults with developing brains, at an increased risk of experiencing seizures. JUUL's defective design
24 also presents a risk of users inadvertently swallowing the juice in the JUULpods. The FDA is currently
25

1 investigating reports of youth and young adults who are experiencing seizures following the use of e-
2 cigarettes.

3 42. Moreover, because vaping introduces foreign substances into the lungs, prolonged use
4 of vaping products is believed to produce chronic obstructive pulmonary disease, just like traditional
5 cigarette smoking. Vaping also triggers immune responses associated with inflammatory lung diseases.
6

7 43. Public health authorities have concluded that e-cigarettes are particularly unsafe for
8 anyone under age 26.²⁰

9 **D. JUUL’S E-CIGARETTE AND NICOTINE JUICE “JUULPODS”**

10 44. Although big tobacco companies had sought to replicate their success with traditional,
11 combustible cigarettes in an electronic cigarette for years, the e-cigarette market began to take
12 substance in 2010. In 2010, NJoy, an Arizona based company, became the industry’s first darling. By
13 2013, e-cigarettes had grown to a \$1.7-billion-a-year business. NJoy’s mistake, however, was
14 marketing an e-cigarette product that looked nearly identical to a traditional cigarette. The stigma that
15 came with being a smoker at the time stymied NJoy’s sales and the company filed for bankruptcy in
16 2016.
17

18 45. JUUL, operating as Ploom at the time, had also launched an e-cigarette product in
19 2010. JUUL’s product resembled a fountain pen. JUUL’s design failed to take off and drew only
20 modest revenues: \$30 million by 2015. To attain the multi-billion-dollar success of traditional
21 cigarettes, which Monsees has described as an “amazing product” and “the most successful consumer
22 product of all time,” JUUL knew it had to switch gears. The gear JUUL chose was not new. Rather,
23
24
25

26 ²⁰ U.S. Surgeon General and the U.S. Centers for Disease Control and Prevention, Office on Smoking
27 and Health, *Know The Risks: E-cigarettes and Young People*, [https://e-
28 cigarettes.surgeongeneral.gov/](https://e-cigarettes.surgeongeneral.gov/) (last visited September 30, 2019).

1 JUUL sought to replicate the financial success of traditional cigarettes by using the same playbook big
2 tobacco used: design a product attractive to youth, market it directly to youth, and misrepresent or
3 conceal its adverse health effects, thereby gaining customers for life.

4 46. To do that, JUUL went straight to the source: tobacco industry product and marketing
5 documents made public under big tobacco's landmark settlements with government officials and
6 injured smokers. According to Monsees, tobacco industry documents "became a very intriguing space
7 for us to investigate because we had so much information that you wouldn't normally be able to get in
8 most industries. And we were able to catch up, right, to a huge, huge industry in no time. And then we
9 started building prototypes."

10 47. Among those tobacco industry documents were documents concerning the process to
11 manipulate nicotine pH to maximize the delivery of nicotine while minimizing "throat hit," *i.e.*,
12 irritation, to appeal to youth and non-smokers. JUUL also hired former big tobacco research and design
13 personnel to help develop JUUL's products.

14 48. With the help of the big tobacco playbook on addicting young consumers to nicotine
15 in hand, JUUL launched its current design in 2015. Knowing it needed a product design that would
16 avoid the stigma associated with smoking traditional cigarettes and ultimately appeal to youth, JUUL's
17 revamped product resembled a device commonly found at schools and in backpacks across the country:
18 a USB flash drive. A user can even charge it in a computer USB drive. JUUL's e-cigarettes are small
19 enough to fit in the user's hand—making it easier to conceal their use by, for example, students—and
20 come in stylish designs and colors.

21 49. Each JUUL e-cigarette has two components. First, the e-cigarette, which holds the
22 battery and temperature regulation system. The thin, rectangular e-cigarette is made up of an aluminum
23 shell, a battery, a magnet for the USB-charger, a circuit board, an LED light, and a pressure sensor.

1 50. Second, a pod, marketed as “JUULpods,” which JUUL claims contain 0.7 milliliters
2 of JUUL’s patented juice made up of nicotine, glycerol and propylene glycol, benzoic acid, and
3 flavorants. JUULpods come in sweet flavors including mango, fruit medley, “cool” mint, “cool”
4 cucumber and crème brulee. The pod is inserted into the end of the e-cigarette device. When the device
5 senses the movement of air, *i.e.*, the user sucking air through it, the liquid is then heated up, creating a
6 vapor, which quickly dissolves into the air. JUUL describes the e-cigarette as an “easy to use
7 vaporizer.” Unlike the distinct odor produced by cigarette smoke, the odor emitted from a JUUL e-
8 cigarette is a reduced aerosol with little or no odor.

28

I. 1. JUUL DESIGNED ITS E-CIGARETTE AND NICOTINE JUICE TO TARGET YOUTH

51. JUUL’s physical design is sleek, stylish, and easily concealed. In combination with
JUUL’s deceptive marketing, discussed below, JUUL’s design portrayed the device as a “must have”
tech product, not a life-threatening nicotine-delivery device. The small USB- shaped design enables
users to conceal the e-cigarette or, if not concealed, the device is often mistaken for a USB flash drive.
The JUUL’s battery indicator light also gratuitously flashes in “party mode” when the user shakes the
device. That feature is not necessary to the proper functioning of the device and intended solely to make
the product appeal to youth.

1 52. In addition to a design that would appeal to youth, JUUL developed a proprietary way
2 of delivering nicotine, by mixing nicotine with a chemical called benzoic acid to produce nicotine salts.
3 JUUL also increased the nicotine “kick” by purportedly using up to 5% nicotine, compared to previous
4 products containing 1%-2% of nicotine that had not been treated with acids. The result is a quicker,
5 stronger, and more palatable delivery of nicotine. The cigarette industry has long known that “nicotine
6 is the addicting agent in cigarettes” and that “nicotine satisfaction is the dominant desire” of nicotine
7 addicts.²¹

8
9 53. Indeed, cigarette companies spent decades manipulating nicotine in order to foster and
10 maintain addiction in their customers. For example, R.J. Reynolds Tobacco Company (“RJR”)
11 developed and patented nicotine salt additives such as nicotine benzoate to increase nicotine delivery
12 in cigarette smoke. As detailed in an RJR memorandum titled “Cigarette concept to assure RJR a larger
13 segment of the youth market,” manipulating the pH of nicotine was expected to give cigarettes an
14 “additional nicotine ‘kick.’”²² This kick was attributed to increased nicotine absorption associated with
15 lower pH.²³

16
17 54. JUUL leveraged the RJR research and conclusions to produce an increased nicotine
18 kick, and thereby fueling increased use and sales of JUUL e-cigarettes. JUUL’s U.S. patent No.
19 9,215,895 (the “’895 patent”) details how “certain nicotine salt formulations provide satisfaction in an
20 individual superior to that of free base nicotine, and more comparable to the satisfaction in an individual

1 smoking a traditional cigarette.”²⁴ The patent states: “the peak concentration of the nicotine in the blood
2 and total amount of nicotine delivered appears comparable to a traditional cigarette.”

3 55. To illustrate its claims, JUUL submitted charts with its ‘895 patent to show that its
4 nicotine salts with a 4% benzoic acid solution closely match the amount of nicotine delivered into the
5 bloodstream by a Pall Mall cigarette. As the chart indicates, a 4% solution of benzoic acid nicotine salt
6 causes a higher (15 ng/mL) peak nicotine-blood concentration than a Pall Mall Cigarette (11 ng/mL).
7

8
9
10 56. JUUL’s manipulation of the concentration of benzoic acid and use of nicotine salts
11 allows JUUL to increase the potency of the nicotine in its JUULpods while reducing “throat-hit” or
12 irritation. Benzoic acid reduces the pH of solutions of nicotine, an alkali with a pH of 8.0 in its
13 unadulterated, freebase form. This reduction in pH converts naturally-occurring unprotonated nicotine,
14 which causes irritation in the throat and respiratory tract, to protonated nicotine, which is not absorbed
15 in the throat or upper respiratory tract and, therefore, does not irritate the throat. A recent study found
16 that JUUL’s e-liquid had a pH of under 6.0, suggesting that the JUUL contains almost no freebase (*i.e.*,
17 non-salt form) nicotine.²⁵
18

19
20 57. JUUL’s creation of a product with low levels of harshness and minimal throat “hit” is
21 consistent with the goal of producing a product for young non-smokers. The non-irritating vapor
22

23
24 ²⁴ U.S. Patent No. 9,215,895 (filed Oct. 10, 2014),

<https://patents.google.com/patent/US9215895B2/en> (last visited September 5, 2019).

25 ²⁵ Lauterbach, *One More Time: Unprotonated Nicotine in E-Cigarette Aerosols: Is It Really There?*
26 (2018), available at www.coresta.org/sites/default/files/abstracts/2018_TSRC83_Lauterbach.pdf.
27 Other studies have confirmed the low ratio of freebase nicotine in JUUL products. See Duell *et al.*,
28 *Free-Base Nicotine Determination in Electronic Cigarette Liquids by H NMR Spectroscopy*, 31
Chem. Res. Toxicol. 431-434, 431 (2018) (“Duell Study”).

1 product is easier for non-smokers to consume without negative side effects like coughing or irritation.
2 The design also shows that JUUL's intention was to recruit non-smokers, not current smokers, because
3 smokers are already tolerant of the throat hit and have even been habituated into associating the "throat
4 hit" with getting their nicotine fix. Minimizing the throat "hit" of JUUL e-cigarettes is therefore
5 unnecessary to providing an alternative for adult smokers but is crucial to luring a new generation of
6 users.
7

8 58. JUUL's lack of throat hit increases the risk of using the product, because it masks the
9 amount of nicotine being delivered, by eliminating the throat sensory feedback normally associated
10 with a large dose of nicotine. The "throat hit" is part of the body's alert system, letting a person know
11 he is inhaling something harmful. Eventually, the irritation to the throat will cause even the most
12 compulsive addict to wait before the next inhalation. Reducing or removing this feedback impairs the
13 user's ability to ascertain that he is consuming a toxin. As a result, the cravings for nicotine can be
14 satisfied nonstop, fostering addiction or aggravating an existing addiction, and repeatedly exposing the
15 user to the health risks associated with the product, such as significantly increased blood pressure.
16

17 59. The physical design of the JUUL device (including its circuit board) and JUULpod
18 determines the amount of aerosolized nicotine the JUUL emits. By altering the temperature, maximum
19 puff duration, or airflow, among other things, JUUL precisely controls the amount of nicotine vapor
20 delivered. JUUL's product design sought to reduce the amount of physical irritation a user experienced
21 while maximizing the amount of nicotine that enters the users' bloodstream. One study found that the
22 "reduced harshness ... may well contribute to the current use prevalence of JUUL products among
23 youth" and that "harshness of the inhaled aerosol," or lack thereof for JUUL, is "relevant regarding abuse
24
25
26
27
28

1 liability.”²⁶ The Duell Study’s findings indicated that JUUL’s harshness is comparable to a nearly
2 nicotine-free 3 mg/mL e-liquid.²⁷

3
4 60. The result is a nicotine product that is easier to ingest and more likely to harm than
5 traditional cigarettes. Former FDA Commissioner David Kessler referred to this as ““facilitating
6 initiation,”” noting that JUUL’s “fundamental design appears to ease young people into using these e-
7 cigarettes and ultimately, addiction.”

8
9 61. A question and response during recent testimony before the House Committee on
10 Energy & Commerce directly implicates JUUL’s actions described herein as causing the youth- vaping
11 epidemic:

12 Representative Kuster of New Hampshire: “Based on [Centers for Disease Control
13 and Prevention (“CDC”)] surveillance and research, what do you believe are the reasons
14 that young people are smoking e-cigarettes at such alarming rates?”

15
16 Dr. Schuchat, Principal Deputy Director of the CDC: “We know that flavors are
17 a principle attractant to young people. Um, the latest generation of e-cigarettes, also, um,
18 are extremely high in nicotine content, they, um, often include nicotine salts which are a
19 little bit more palatable or um less bitter and the flavors are, you know, really targeted at
20 youth. So we think the addictiveness of the high nicotine level and the appeal of the
21 flavors are key. We also think some of the companies have had, um, youth-targeting ads.”

22
23
24
25
26
27 ²⁶ Duell Study at 431, 433.

28 ²⁷ *Id.* at figure 3.

1 Medicines and Healthcare Products Regulatory Agency notes: “an e-cigarette with a concentration of 20
2 mg/ml delivers approximately 1 milligram of nicotine in 5 minutes (the time needed to smoke a
3 traditional cigarette, for which the maximum allowable delivery is 1 mg of nicotine).” JUUL’s nicotine
4 concentration has been found to be 60 mg/ml, and JUUL’s salt form increases the rate and efficiency of
5 nicotine delivery. JUULpods therefore substantially exceed the nicotine dose of a traditional cigarette.
6

7 66. As of May 2016, the European Union had banned e-cigarettes with a concentration
8 exceeding 20 mg/ml nicotine. Israel banned the import and sale of JUUL’s e- cigarettes in August 2018,
9 calling JUUL’s high nicotine concentration levels “a danger to public health.”

10 67. Comparison of available data regarding per puff nicotine intake further indicates that
11 JUUL delivers about 30% more nicotine per puff. A recent study of JUULpods found that “[t]he
12 nicotine levels delivered by the JUUL are similar to or even higher than those delivered by cigarettes.”³⁰
13 The Reilly Study tested JUUL’s Tobacco, Crème Brulee, Fruit Punch, and Mint flavors and found that,
14 based on a puff volume of 75/mL, a puff of JUUL delivered 164 ± 41 micrograms of nicotine per puff.
15

16 68. By comparison, a 2014 study using larger 100 mL puffs found that a Marlboro cigarette
17 delivered 152—193 $\mu\text{g}/\text{puff}$.³¹ Correcting to account for the different puff sizes between the Reilly and
18 Schroeder studies, this suggests that, at 75mL/puff, a Marlboro would deliver between 114 and 144
19 $\mu\text{g}/\text{puff}$. In other words, empirical data suggests that JUUL delivers up to 36% more nicotine per puff
20 than a Marlboro.
21
22
23
24

25 ³⁰ Reilly *et al.*, *Free Radical, Carbonyl, and Nicotine Levels Produced by JUUL Electronic*
26 *Cigarettes*, *Nicotine Tob. Res.* 3 (Oct 20, 2018), available at
<https://www.ncbi.nlm.nih.gov/pubmed/30346584> (the “Reilly Study”).

27 ³¹ Schroeder & Hoffman, *Electronic Cigarettes and Nicotine Clinical Pharmacology*, *Tobacco Control* 2014; 23:ii30-ii35
28 (May 2014), available at www.ncbi.nlm.nih.gov/pmc/articles/PMC3995273/.

1 69. Because “nicotine yield is strongly correlated with tobacco consumption,”³² a
2 JUULpod with more nicotine will strongly correlate with higher rates of consumption of JUULpods.
3 For example, a historic cigarette industry study looking at employees who smoked found: “the number
4 of cigarettes the employees smoked per day was directly correlated to the nicotine levels.” In other
5 words, the more nicotine in the cigarettes, the more cigarettes a person smoked.
6

7 70. By delivering such potent doses of nicotine, JUUL products magnify the health risks
8 posed by nicotine, significantly increase blood pressure, and place users at a heightened (and concealed)
9 risk for stroke, heart attacks and other cardiovascular events.

10 71. Further, because JUUL’s nicotine salts actually increase the rate and magnitude of
11 blood plasma nicotine compared to traditional cigarettes, the risk of nicotine addiction and abuse is
12 higher for JUUL e-cigarettes than traditional cigarettes. Thus, JUULpods are foreseeably exceptionally
13 addictive when used by persons without prior exposure to nicotine—a fact not disclosed by Defendant.
14

15 72. At the same time, as discussed above, the throat “hit” from nicotine salts is much lower
16 than that for combustible tobacco products, making it easier to inhale. Indeed, one study found that
17 “[e]-liquids designed to combine high total nicotine level (addictive delivery) with ... ease of
18 inhalation[] are likely to be particularly problematic for public health.”³³
19

20 73. Despite the above data, Defendant has failed to disclose to consumers that the
21 JUULpods’ nicotine salt formulation delivers an exceptionally potent dose of nicotine.

22 74. For example, prior to releasing its new version of c-cigarette and JUULpods in 2015,
23 JUUL provided press outlets with information regarding the products, as well as free JUUL products.
24

25
26 ³² Jarvis *et al.*, *Nicotine Yield From Machine Smoked Cigarettes and Nicotine Intakes in Smokers: Evidence From*
27 *a Representative Population Survey*, JNCI Vol. 93, Issue 2, 134–138 (Jan 2001), available at
<https://academic.oup.com/jnci/article/93/2/134/2906355>.

28 ³³ Duell Study at 431.

1 Among other websites that posted articles about JUUL prior to the product release, technology website
 2 TechCrunch posted a chart JUUL provided it that compares the results for two versions of the JUUL
 3 device: a generic “combustion cigarette” and a generic “traditional e-liquid.”
 4

14 75. JUUL posted a similar chart on its own website when it debuted the new products.

17 Actual nicotine consumed may vary by user

19 76. Both charts, provided to TechCrunch and others prior to JUUL’s 2015 product release
 20 and published by TechCrunch and others at that time, claim that, at its peak, the JUUL delivers
 21 approximately 25% less nicotine to the blood than a combustible cigarette. As discussed herein, that is
 22 false. The statements in JUUL’s 2015 charts misrepresented the true nicotine delivered by JUUL’s
 23 products and the resulting increased risk of nicotine addiction and severe health consequences resulting
 24 from high levels of nicotine consumption.
 25
 26
 27
 28

1 77. JUUL further misrepresents the amount of nicotine delivered by its products, including
2 JUUL's comparisons of JUULpods to "1 pack of cigarettes or 200 puffs," because JUUL's nicotine salt
3 proprietary formula delivers higher concentrations of nicotine to a user's bloodstream.
4

5 78. Assuming a concentration of 59 mg/mL, JUUL's reported nicotine content corresponds
6 to about 40 mg of nicotine per 0.7 mL JUULpod. If, as JUUL claims, this is equivalent to a single 20-
7 cigarette pack, that implies 2 mg of nicotine per cigarette.

8 79. JUUL's equivalency claim further assumes 10 puffs per cigarette (*i.e.*, 200 puffs per
9 pack), or 0.2 mg (200 µg) of nicotine per puff.

10 80. "Typically, a cigarette that delivers approximately one milligram of nicotine in smoke
11 ... retains 'about 14-20 milligrams of nicotine in the unsmoked rod,'" *USA v. Philip Morris USA, Inc.*,
12 449 F. Supp. 2d 1, 337 (D.D.C. 2006), for an overall delivery of 5-7% of the cigarette's actual nicotine
13 content. A study by the CDC found that in "commercial cigarette brands, nicotine concentrations ranged
14 from 16.2 to 26.3 mg nicotine/g tobacco (mean 19.2 mg/g; median 19.4 mg/g)."³⁴ Assuming an average
15 of 19 milligrams of nicotine per cigarette, a pack of cigarettes contains on average 380 milligrams of
16 nicotine, or six times as much nicotine as the 62 milligrams reported for each JUULpod. And the
17 average pack would be expected to deliver only 5-7% (19-27 mg) of its nicotine content to the user. In
18 line with this expectation, a study of thousands of smokers found smokers intaking between 1.07 to
19 1.39 milligrams per cigarette (21.4-27.8 mg per pack).³⁵ This is less than half of the amount of nicotine
20 contained in a JUULpod (*i.e.*, 2 mg per "cigarette" based on JUUL's stated concentration, or 200 µg
21
22
23
24

25 ³⁴ Lawler *et al.*, *Surveillance of Nicotine and pH in Cigarette and Cigar Filler*, *Tob. Regul. Sci.*
26 3(Suppl 1): 101–116 (Apr 1, 2018), available at www.ncbi.nlm.nih.gov/pmc/articles/PMC5628511/.

27 ³⁵ Jarvis *et al.*, *Nicotine Yield From Machine-Smoked Cigarettes and Nicotine Intakes in Smokers: Evidence From a*
28 *Representative Population Survey*, *JNCI*, Vol. 93, 2:134–138 (Jan 17, 2001), available at
www.ncbi.nlm.nih.gov/pubmed/11208883.

1 per puff assuming 100% delivery). Even with the slightly lower efficiency of delivery demonstrated in
2 studies like the Reilly Study (about 82%, for averages of 164 µg per puff), this amounts to a
3 substantially higher amount of nicotine that a human will absorb from a JUULpod than from smoking
4 a pack of cigarettes.

5
6 81. JUUL's statement in its advertisements that each JUULpod contains about as much
7 nicotine as a pack of cigarettes is, thus, false and misleading because the actual amount of nicotine
8 consumed via JUULpods is as much as twice as high as that consumed through combustible cigarettes.

9
10 82. Further, while a pack of cigarettes contains 20 cigarettes that a smoker must separately
11 remove from the pack and light, a JUULpod can be inhaled without interruption. JUUL e-cigarettes do
12 not have a manual or automatic "off" switch, unlike a combustible cigarette that self-extinguishes when
13 finished. And JUUL products often can be used indoors without detection by others, a feature that
14 JUUL promoted heavily in its advertisements, eliminating the need for smoking breaks. Thus, the
15 device design facilitates and results in consumption of far more nicotine than would occur with
16 cigarettes.

17
18 83. Finally, JUUL failed to disclose additional risks posed by JUUL's "Cool" Mint and
19 Menthol pods. The FDA's Tobacco Products Scientific Advisory Committee in March 2011 issued a
20 report on menthol cigarettes, concluding that the minty additive was not just a flavoring agent but had
21 drug-like effects, including "cooling and anesthetic effects that reduce the harshness of cigarette
22 smoke."³⁶ Mint and menthol could also "facilitate deeper and more prolonged inhalation," resulting in
23 "greater smoke intake per cigarette."³⁷

24 **E. JUUL'S MARKETING CAMPAIGN**

25
26 ³⁶ Proctor, *Golden Holocaust: Origins of the Cigarette Catastrophe and the Case for Abolition*, 500
27 (1st ed. 2011).

28 ³⁷ *Id.* at 500 – 501.

1
2
3
4

1. JUUL Learns from Big Tobacco and Employs Youth-Oriented Marketing Tactics Prohibited for Manufacturers of Combustible Cigarettes

5
6
7
8
9
10
11
12

84. With a physical design that appealed to youth and a more powerful and addictive nicotine delivery system, all JUUL was missing was a plan to attract its target audience. Again, JUUL took a page out of the big tobacco playbook. According to Monsees, JUUL aimed to “deliver[] solutions that refresh the magic and luxury of the tobacco category.” Indeed, Monsees has admitted that JUUL studied tobacco industry documents. In a 2018 interview, “Monsees indicated that the design of JUUL’s advertising had been informed by traditional tobacco advertisements and that [the Stanford Research into Impact of Tobacco Advertising] had been quite useful to them.”³⁸

13
14
15
16
17

85. One thing learned from the cigarette epidemic is that marketing played a substantial role in youth smoking initiation. Big tobacco studied the propensities of youth and formulated content and strategies to attract and retain new, young smokers. That marketing, including the depiction of young, attractive peers smoking cigarettes was, unfortunately, highly successful.

18
19
20

86. Notably, many of the practices employed by big tobacco are prohibited by the 1998 Master Settlement Agreement between big tobacco, government officials, and injured smokers. Specifically:

21
22
23
24
25

Prohibition on Youth Targeting. No Participating Manufacturer may take any action, directly or indirectly, to target Youth within any Settling State in the advertising, promotion or marketing of Tobacco Products, or take any action the primary purpose of which is to initiate, maintain or increase the incidence of Youth smoking within any Settling State.

26
27
28

³⁸ Robert K. Jackler, M.D. et al, *JUUL Advertising Over Its First Three Years on the Market* (Jan. 21, 2019) (the “Stanford Report”).

1 87. Among other activities, the Master Settlement Agreement prohibits in large part the
2 use of cartoons in advertising, sponsoring of concerts or other events with an intended or actual
3 audience containing youth, sponsoring sporting events, billboard advertising, and free samples outside
4 of adult-only facilities. The Agreement also prohibits the use of third-parties or agents to carryout
5 activities the tobacco manufacturer could not perform itself. JUUL is not subject to the Master
6 Settlement Agreement.
7

8 88. The Tobacco Control Act of 2009 banned cigarette sales to minors and placed other
9 restrictions on marketing to youth, including banning tobacco-brand sponsorships of sports and
10 entertainment events or other social or cultural events, vending machine sales, free giveaways of sample
11 cigarettes, and brand-name non-tobacco promotions items. The Tobacco Control Act also prohibits
12 tobacco companies from making “modified risk” claims without scientific support and an FDA order.
13 As discussed above, the FDA gained authority over e-cigarettes in 2016 but exercised its enforcement
14 discretion to permit products previously on the market to remain on the market.
15

16 89. Because JUUL was not subject to the Master Settlement Agreement, and not yet
17 directly under the thumb of the FDA, JUUL was free to capitalize on marketing practices known to be
18 highly-successful at addicting youth to nicotine products. And capitalize it did.
19

20 90. Nicknamed “Vaporized,” JUUL’s early marketing depicted flirtatiously posed young
21 people holding JUULs. JUUL’s advertisements mimicked those of big tobacco and traditional
22 cigarettes, including colorful ad images using eye-catching designs and youth- oriented imagery touting
23 themes of being “cool,” “carefree,” “stylish,” “attractive,” “sexy,” “pleasureful,” “popular” and that
24 JUUL e-cigarettes are “great tasting.” JUUL associated its product with one of the trendiest products
25 of all-time, the Apple iPhone. By calling it “the iPhone of e-cigarettes” on JUUL’s website, social
26 media, and email campaigns, JUUL portrayed its e-cigarette as a must have tech gadget.
27
28

91. Among other print media, JUUL ran a full-paged spread in *Vice* magazine. Vice has marketed itself as the “#1 youth media company” in the world. JUUL also advertised on a 12-panel display over Times Square.

92. JUUL’s marketing also included attractive young people distributing free JUULs at movie and music events. The Stanford Report identified at least 25 JUUL “youth-oriented entertainment events, usually either music or cinema themed, whose primary purpose was to distribute free samples of JUUL devices and flavor pods to a youthful audience.”⁴⁰ The “average number of samples/event distributed equals 5,000+” JUUL Starter-Kits.⁴¹ That equates to 20,000 packs of cigarettes at each event, or 500,000 packs of cigarettes total. Although JUUL claims its marketing changed after 2015, in December 2017 “JUUL tweeted an invitation for a ‘demo event’ for \$1 in Miami.” And in April 2018, JUUL promoted an event where new users could learn “how to use your

³⁹ Stanford Report at 8.

⁴⁰ Stanford Report at 5.

1 device and sample #juulpod flavors.” JUUL sampling event invitations followed JUUL’s bright-
2 colored, young-models template.⁴²

27 ⁴² *Id.*

1 93. As the “Vaporized” campaign was rolled out, John Schachter with the Campaign for
2 Tobacco-Free Kids “expressed concern about the Juul campaign because of the youth of the men and
3 women depicted in the campaign, especially when adjoined with the design.” Mr. Schachter said: “the
4 organization has noticed obvious trends that appeal to adolescents in e- cigarette campaigns such as
5 celebrity endorsements, sponsorships, and various flavors.”
6

7 94. The highly-successful “Vaporized” campaign was created by JUUL’s Creative Director
8 Steven Baillie along with Cult Collective LP (“Cult Collective”) and Grit Creative, LLC (“Grit”). Cult
9 Collective has admitted the “Vaporized” campaign “created ridiculous enthusiasm.” JUUL’s
10 “Vaporized” campaign failed to warn consumers about the risks of vaping and nicotine addiction or,
11 remarkably, even that JUUL’s products contained nicotine. When nicotine warnings were present, they
12 were in low contrast, small font that was intended to be overlooked or, for internet-based advertisements,
13 positioned such that smartphone users may not even see them without clicking for additional
14 information.
15

16 **III. 2. JUUL USES SOCIAL MEDIA TO INUNDATE YOUTH**

17
18 95. Although JUUL utilized multiple outlets to reach its target audience with its
19 “Vaporized” and similar youth-oriented marketing, perhaps the most successful strategy was JUUL’s
20 use of social media advertising to create a viral marketing campaign.
21

22 96. “Viral marketing” is defined as ““marketing techniques that seek to exploit pre- existing
23 social networks to produce exponential increases in brand awareness, through processes similar to the
24 spread of an epidemic.””⁴³ Viral marketing is akin to word-of-mouth recommendations, accelerated
25 exponentially by the network effect of the internet. The goal in a viral marketing campaign is to turn
26

27
28

⁴³ Larson, *The Rise of Viral Marketing through the New Media of Social Media*, Liberty University, Faculty Publications and Presentations (2009), available at https://digitalcommons.liberty.edu/cgi/viewcontent.cgi?article=1009&context=busi_fac_pubs.

1 customers into unwitting salespeople who repeat a company’s representations on its behalf.

2 97. Companies may use different media to transmit their viral messaging, but generally, all
3 viral marketing campaigns tend to share similar features, including (1) a simple message—typically
4 implied by an image—that elicits an emotional response; (2) the strategic use of marketing platforms,
5 especially social media, to reach and engage the target audience; (3) use of content that invites
6 participation and engagement; and (4) use of third parties to magnify the impact of a message.
7

8 98. Typically, a viral marketing campaign will begin with a “push” by the company seeking
9 to advertise the product, and since the advent of social media, that push is typically done through the
10 creation of new content on a social media platform, such as Instagram, YouTube, Twitter, Facebook or
11 other similar platform.⁴⁴ A company that wants to push an ad on social media platforms has a few
12 options. First, the company can solicit followers to its social media pages, so that when the company
13 posts to its own social media feed, the content would be delivered to those followers and to those who
14 visited the company page. Second, the company can purchase paid advertisements that are delivered to
15 specified target audiences. To amplify a message, companies can the use other tools, like paid
16 influencers and hashtags, to blanket the target demographic.
17

18 99. Companies seeking to advertise new products or reach a new demographic have
19 discovered the power of the “like” and “share” features on social media, which allow users to promote
20 content to their own audiences. As Mark Zuckerberg, founder and Chief Executive Officer (“CEO”) of
21 Facebook explained: “Nothing influences people more than a recommendation from a trusted friend. A
22

23
24
25
26 ⁴⁴ Skrob, *The viral marketing concept as a model for open source software to reach the critical*
27 *mass for global brand awareness based on the example of TYPO3*, University of Applied Science Kufstein,
28 Austria (Aug 2005), available at [http://citeseerx.ist.psu.edu/viewdoc/
download?doi=10.1.1.494.8779&rep=rep1&type=pdf](http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.494.8779&rep=rep1&type=pdf).

1 trusted referral influences people more than the best broadcast message. A trusted referral is the Holy
2 Grail of advertising.”

3 100. Today’s youth often are opposed to large, corporate product pushes, preferring more
4 grassroots or start-up product offerings. Thus, a viral marketing campaign such as that implemented by
5 JUUL seeks to appear organic rather than corporate-driven advertising. JUUL’s social media campaign,
6 including the use of the paid social media influencers and viral hashtag advertising, was highly-
7 coordinated and focused to persuade those who use social media—youth—that JUULing was the latest
8 cool trend and healthy.
9

10 101. JUUL focused on social media because it knew that the predominant users of social
11 media are youth. 95% of teens report having use of a smart phone and 88% have a computer.⁴⁵ “Roughly
12 nine-in-ten teens go online at least multiple times per day,” with 45% reporting they are “online on a
13 near-constant basis.”⁴⁶ 85% use YouTube.⁴⁷ 72% use Instagram.⁴⁸ 69% use Snapchat.⁴⁹ JUUL knew
14 that viral marketing campaigns on social media prey on teenagers’ need to fit in and appear cool to their
15 friends. Following trends on social media, set by influencers and others held out as trendsetters and cool,
16 is instinctive for teenagers.
17

18 102. In addition, paid social media advertising can be tailored to a target audience, *e.g.*,
19 youth, based on data points collected by social media platforms. Those same data points also allow
20 advertisers like JUUL to see who is viewing their ads. JUUL undoubtedly tracked who viewed its social
21 media advertisements.

⁴⁸ *Id.*

⁴⁹ *Id.*

1 103. The Stanford Report analyzed JUUL’s marketing campaign between its launch in 2015
2 and fall 2018. The researchers scrutinized thousands of social media posts (Instagram, Facebook,
3 Twitter), emails to consumers, and ads (including internet-based ads JUUL has since deleted). The
4 Report’s conclusion is damning: *JUUL’s marketing was “patently youth-oriented. For the next 2 ½*
5 *years it was more muted, but the company advertising was widely distributed on social media channels*
6 *frequented by youth, was amplified by hashtag extensions, and catalyzed by compensated influencers*
7 *and affiliates.”*⁵⁰ Matt Myers, president of the Campaign for Tobacco-Free Kids observed: *“It’s*
8 *impossible to review the data [in the paper] and conclude anything other than the marketing is the*
9 *major reason this product became so popular among young people.”* As Massachusetts Attorney
10 General Maura Healey said regarding her office’s investigation into JUUL’s marketing campaign: “This
11 is about getting kids to start vaping, and make money and have them as customers for life.”
12

13
14 104. In addition to JUUL’s countless postings on its own social media accounts, a highly
15 effective strategy employed by JUUL was to hire the Social Media Influencers—social media
16 personalities with large followers of the target demographic—to promote JUUL’s products.⁵¹ As
17 discussed, teenagers have a heightened need to follow social norms and be perceived as cool by their
18 peers. By using the Social Media Influencers, JUUL created the perception that its products were being
19 voluntarily used and promoted by individuals teenagers were likely to look to for cues on how to behave.
20 JUUL created hashtags – #JUUL, #JUULvapor, #switchtoJUUL, #vaporized – to facilitate
21 dissemination of its youth-oriented marketing. JUUL’s Social Media Influencers would post youth-
22 targeted advertising, often featuring images of young people JUULing, with JUUL’s hashtags.
23

24 105. As the Stanford Report found:
25

26 ⁵⁰ Stanford Report at 1 (emphasis added).

27 ⁵¹ The identities of the Social Media Influencers are largely unknown to Plaintiff but within
28 Defendant’s possession. One influencer Plaintiff is aware of is Christina Zayas. See Nedelman, *et al.*,
#JUUL: How social media hyped nicotine for a new generation, CNN (Dec. 19, 2018), available at
<https://www.cnn.com/2018/12/17/health/juul-social-media-influencers/index.html>.

1 JUUL has employed influencers – social media users with sizable followings
2 recruited to increase brand awareness and to inspire sales. Confirming that JUUL used
3 influencers since its inception was a June 2015 listing for an Influencer Marketing
4 Intern. The job description makes clear: “*The Influencer Marketing Intern will create
5 and manage blogger, social media and celebrity influencer engagements ... to build
6 and nurture appropriate relationships with key influencers in order to drive positive
7 commentary and recommendations through word of mouth and social media channels,
8 etc.*”

9 Influencers are a form of paid promotion. For example, an influencer may earn
10 \$1000 for each 100,000 followers. A particularly well-documented example is that of
11 DonnySmokes (Donny Karle, age 21), whose JUUL “unboxing” YouTube video
12 garnered some 52,000 views. With 120,000 subscribers on his YouTube channel, Mr.
13 Karl was able to earn a good income stream from vapor companies before YouTube
14 interrupted his channel. In October 2018, JUUL’s website still requests applications to
15 “*Join the JUUL Influencers.*”⁵²

16 106. JUUL also allowed third parties to use its trademark when it benefitted JUUL, even if
17 the third party was promoting prohibited use of JUUL’s products. For example, Twitter user
18 @JUULnation’s posts on social-media platform Instagram included tips on how to conceal JUUL in
19 school and dismissed efforts to combat use of JUUL’s products by youth. JUUL promoted
20 @JUULnation on JUUL’s own Instagram account.

21 107. JUUL’s social media, youth-focused marketing worked. The Surgeon General’s
22 Advisory on E-Cigarette Use Among Youth found that JUUL’s Twitter account was being followed by
23 adolescents and that 25% of those retweeting official JUUL tweets were under 18. The National Youth
24 Tobacco Survey has found that 78.2% of middle and high-school students — 20.5 million youth—had
25 been exposed to e-cigarette advertisements.

26 108. JUUL also used an undisclosed “affiliate program” and JUUL affiliates to attract
27

28

⁵² Stanford Report at 19 – 20.

1 customers to JUUL’s website. The Stanford Report describes the program:

2 JUUL has used an affiliate program which makes payouts to online sites which
3 refer business to them. In the vaping industry, this most often takes the form of sites
4 which review the product favorably and include a link to the product’s website,
5 especially to their “*buy now*” section. JUUL partnered with the company Impact
6 Radius (<https://impact.com/>) whose goal is to: “*optimize partner marketing*
7 *investments.*” In their affiliation application, JUUL explained: *How it works: You get*
8 *paid by advertising performance campaigns to your audience on your blog, website,*
9 *newsletter, search landing page. Depending on the specific terms of our agreement*
10 *you can get paid as frequently as daily using direct deposit into your bank account. It*
11 *goes on to specify: “The purpose of this Agreement is to allow HTML linking between*
12 *your web site and the JUULvapor.com web site” and “At all times, you must clearly*
13 *represent yourself and your web sites as independent from JUULvapor.com.”*

14 JUUL offers payment of as much as 25% of net sales for new customers and
15 10% of net sales for existing customers. On October 31, 2018 JUUL halted its affiliate
16 program. JUUL did not wait for an internet admirer to apply to its affiliates program.
17 In response to a complimentary tweet on JUUL’s Twitter feed, the company replied
18 with an invitation for the individual to join the affiliates program 18 times (15 in 2017
19 and 3 in 2018).⁵³

20 109. JUUL also carried out extensive email campaigns—roughly 200 email promotions
21 between 2015 and 2018. But, like its other advertising, JUUL’s email subscription list was not age-
22 restricted. Remarkably, until recently, consumers who failed JUUL’s age verification process on
23 JUUL’s website were still added to JUUL’s mailing list and emailed a coupon for a discounted Starter
24 Kit.

25 IV. 3. JUUL’S POINT-OF-SALE ADVERTISING

26 110. Another prong of JUUL’s multi-faceted push to adolescents was its in-store product
27 displays, or “point-of-sale” advertising. JUUL knew that younger smokers were more likely to be
28

⁵³ *Id.* at 22.

1 influenced by point-of-sale advertising to make unplanned purchases.⁵⁴ Indeed, “youth who were
2 frequently exposed to [point-of-sale] tobacco marketing were twice as likely to try or initiate smoking
3 than those who were not as frequently exposed.⁵⁵ To start, JUUL designed packaging that would appeal
4 to teenagers. JUUL’s bright, white packaging with clean lines resonated with youth who had been
5 conditioned to such themes by companies like Apple in promoting its iPhones and iPads—products that
6 teenagers associate with being trendy and stylish.

7
8 111. Compounding the youth-oriented nature of JUUL’s point-of-sale advertising was the
9 fact that for years JUUL placed its products exclusively in gas stations as opposed to smoke shops.
10 JUUL knew that teenagers were more likely to frequent gas stations and, by contrast, may not even be
11 allowed in smoke shops. Worse yet, *JUUL had its retailers display JUUL products on retail shelves,*
12 *not behind the counter with traditional cigarettes.* JUUL’s point-of- sale advertising from 2015 through
13 late 2018 failed to disclose that JUUL’s products contained nicotine or otherwise adequately warn of
14 the harmful effects of using JUUL’s products. JUUL took every step imaginable to convey to consumers
15 that JUUL’s products were not comparable to traditional cigarettes but, rather, safe and intended for
16 youth.
17

18 V. 4. JUUL’S YOUTH-ORIENTED FLAVORING
19

⁵⁵ *Id.*

1 112. JUUL further targeted youth by manufacturing, selling, and promoting an array of
 2 youth-oriented flavors for its JUULpods. JUULpods came in sweet flavors including mango, fruit
 3 medley, “cool” mint, “cool” cucumber and crème brulee. Research has shown that youth believe
 4 advertisements for flavored vaping and e-cigarette liquids and products are intended for them.⁵⁶
 5 According to one survey, 81% of youth e-cigarette users reported that the first product they used was
 6 flavored and 81.5% reported product flavoring as a reason for use.⁵⁷
 7

14 113. Again, this was a page out of the big tobacco playbook. A 1972 internal memorandum
 15 at Brown & Williamson—party to the Master Settlement Agreement—recommending the company
 16 consider sweet-flavored cigarettes, stated: “It’s a well known fact that teenagers like sweet products.
 17 Honey might be considered.”⁵⁸ Likewise, a 1979 memorandum at Lorillard—also party to the Master
 18 Settlement Agreement—considered how to attract “younger” users.⁵⁹ The memorandum concluded
 19 “less tobacco taste” was the answer and suggested the company “investigate the possibility of borrowing

<http://swatflorida.com/uploads/fightresource/Flavored%20Tobacco%20Industry%20Quotes%20and%20Facts.pdf> (last visited Sep. 12, 2019).

1 switching study data from the company which produces ‘Life Savers’ as a basis for determining which
2 flavors enjoy the widest appeal.”⁶⁰ And a 1978 report compiled for Lorillard found: “In psychological
3 terms, what tastes and smells good, what one enjoys, cannot be ‘so bad.’”⁶¹

4
5 114. The FDA banned flavored cigarettes in 2009, stating: “flavored cigarettes are a gateway
6 for many children and young adults to become regular smokers.” As Dr. Schuchat of the CDC recently
7 testified: “We know that flavors are a principle attractant to young people.”

8 115. JUUL’s advertising emphasized the flavors of its sweetened nicotine pods. JUUL even
9 advertised JUULpods as part of a meal, to be paired with other foods. In late 2015, JUUL began a food-
10 based advertising campaign called “Save Room for JUUL.” A play on the expression “save room for
11 dessert,” JUUL’s campaign focused on the JUULpods’ sweet flavors, and pairing them with foods.
12 JUUL described its crème brulee nicotine pods as “the perfect evening treat” and encourage users to
13 “indulge in dessert without the spoon.” In one 2016 email, JUUL bluntly suggested that users satisfy
14 their sugar cravings with JUUL’s highly-addictive nicotine vapor: “Have a sweet tooth? Try Brulee.”
15
16
17
18
19
20
21

28 ⁶⁰ *Id.*

⁶¹ *Id.*

1 based advertisements suggest that JUUL should be part of a comfortable routine, like a cup of coffee.
2 This comparison to coffee was an intentional effort to downplay and minimize the risks of JUUL,
3 suggesting it was no riskier than coffee; a tactic utilized by tobacco companies for decades to equate
4 nicotine with caffeine.
5

6
7 119. By positioning JUULpods as a delicious treat rather than a system for delivering a
8 highly addictive drug with dangerous side effects, JUUL deceptively led consumers to the conclusion
9 that JUULpods were not only healthy (or at least essentially harmless), but also a pleasure to be enjoyed
10 regularly, without guilt or adverse effect.

11 120. By modeling its nicotine pods' flavor profiles on sweets, naming its nicotine pods after
12 those sweets, and using images of the sweets in JUULpod advertisements, JUUL conditioned viewers
13 of its advertisements to associate JUUL with those foods. Through this conditioning process, Defendant
14 sought to link the sight or mention of JUUL products to mental images of the fruits and desserts in
15 JUUL's advertising, which would in turn trigger food-based physiological arousal including increased
16 salivation and heart rate. These physiological responses, in turn, would make JUUL use more appealing.
17

18 **VI. 5. JUUL ATTEMPTS TO REWRITE HISTORY**

19
20 21. In 2016, JUUL made some changes to its marketing, but the deception and intent to
21 target youth remained. For instance, JUUL's marketing would often depict themes like socialization and
22 romance or style and identity. Instagram and Facebook ads included photos of pop-star Katy Perry with
23 a JUUL at the Golden Globes. But most glaring was what JUUL did not include in their advertising:
24 adult smokers JUUL claimed it was targeting to switch from traditional cigarettes to JUUL.
25

26 122. JUUL's more recent marketing has included live testimonials from adults who claim to
27 have switched from cigarettes to JUUL. But according to Robert K. Jackler, M.D., one of the Stanford
28 Report's authors: "The JUUL hashtag lives on. It's immortal. It's still viral in peer-to-peer teen

1 promotion.” “The fact that Juul shut down its own social media postings had little effect,” Dr. Jackler
2 said.

3
4 123. After the FDA opened an investigation and lawsuits were filed, JUUL set out to rewrite
5 its history, JUUL added nicotine warnings to its product packaging in August 2018. Prior to that, they
6 had only contained California Proposition 65 warnings indicating that the product contains a substance
7 known to cause cancer and a warning to keep JUULpods away from children and pets, but nothing about
8 the known effects, or unknown long-term effects, of vaping nicotine salts.

9
10 124. JUUL has removed from its website, and much of the internet, images of glamorous
11 young models seductively exhaling clouds of vapors. JUUL’s website now features middle-age adults
12 in non-glamorous settings and suggests that JUUL solely exists for the benefit of adult smokers looking
13 for an alternative.

14
15 125. Although JUUL now markets its product as a smoking cessation device (“Switch to
16 JUUL”), as discussed below, it has not received FDA approval as a modified risk tobacco product or as
17 a nicotine replacement therapy, and JUUL’s e-cigarette has not participated in any FDA approval
18 process analyzing its risks and benefits. JUUL’s “Switch” campaign, promoting the benefits of vaping
19 JUULpods compared to combustible cigarettes create a false impression that JUUL products had been
20 approved as smoking cessation devices and found to be safer than combustible cigarettes. That is not
21 the case.

22
23 126. While JUUL has also announced some half-hearted voluntary measures to reduce
24 access to young people, the cat cannot go back in the bag. The viral marketing campaign and images
25 live on, the candy flavors are still available, and the product remains designed to maximize the nicotine
26 delivery for young people, leading to devastating health consequences.

27
28 127. After addicting scores of youth to its product, JUUL now claims its marketing was never
geared towards youth. But as a former senior manager at JUUL has admitted, JUUL was “well aware it

1 could appeal to [teenagers].” And, in fact, as JUUL’s e-cigarettes went on sale in June 2015, it was
2 quickly apparent that teenagers were seduced by the marketing and were picking up JUUL’s addictive,
3 harmful products in droves. Indeed, some customers purchased more JUUL products than one could use,
4 sometimes 10 or more devices. Indeed, by the end of 2015, users had posted tens of thousands of videos
5 on YouTube showing students how to “JUUL in school” without getting caught.
6

7 128. On September 25, 2019, JUUL announced that it was “suspending all broadcast, print
8 and digital product advertising in the U.S.” and that JUUL would not fight the federal government’s
9 proposed U.S. ban on flavored e-cigarettes, which the FDA is set to begin implementing any day. In
10 addition, JUUL CEO Kevin Burns unexpectedly stepped down. But, as discussed below, these actions
11 were too late as JUUL’s deceptive and illegal conduct had already succeeded in addicting a generation
12 of America’s youth to its nicotine products. Indeed, demonstrating its callous attitude towards nicotine
13 abuse, JUUL appointed K.C. Crosthwaite as its new CEO. Crosthwaite is an Altria—big tobacco—
14 veteran. A week later, JUUL hired another Altria executive, 24-year Altria veteran Joe Murillo, as
15 JUUL’s new chief regulatory officer.
16

17 **VII. 6. JUUL’S MARKETING WAS DECEPTIVE**
18 **AND FAILED TO WARN OF THE RISKS ASSOCIATED WITH**
19 **USE OF ITS E-CIGARETTE AND JUULPODS**

20 129. From its product release in 2015 and continuing through today, JUUL’s marketing,
21 discussed above, has misrepresented and concealed material information regarding its products and their
22 operation. Specifically, as detailed above, JUUL misstated and omitted material facts in social media
23 posts—both its own posts and posts of its Social Media Influencers, advertisements on JUUL’s website,
24 email messages, print materials including 2015 full-page ads in *Vice* magazine, point-of-sale advertising,
25 free JUUL distribution events, and “education” programs to schools and youth (discussed below).
26

27 130. As demonstrated above, JUUL’s marketing misrepresents or fails to adequately disclose
28 that its products contain nicotine or how much nicotine JUUL products deliver to a user’s bloodstream,

1 including as compared to combustible cigarettes, as well as the benzoic acids levels. JUUL’s marketing
2 further omitted the increased risk of addiction, physiological effects, and other severe health risks the
3 higher-than-disclosed levels of nicotine delivery pose to a JUUL user. Instead, JUUL intentionally
4 created a misleading impression that JUUL’s products were intended for youth, were totally safe or at
5 least safer than combustible cigarettes, and were not a nicotine delivery device but, rather, a trendy tech
6 product that should be associated with products like the wildly popular iPhone.
7

8 131. As the FDA made clear in a September 9, 2019 warning letter, JUUL violated the
9 Federal Food, Drug, and Cosmetic Act when it advertised its e-cigarettes and nicotine juice as modified
10 risk tobacco products without an appropriate FDA Order in effect. JUUL’s “Switch” campaign, like its
11 earlier marketing, thus, continues the parade of misstatements and omissions of material facts regarding
12 the design and use of JUUL products.
13

14 132. To this day, JUUL has not disclosed the true health risks associated with its products,
15 has not recalled or modified its products despite the known risks, and continues to foster a public health
16 crisis, placing millions of young people in harm’s way.
17

18 **F. JUUL TARGETS SCHOOLS**

19 133. In addition to the purposeful targeting of student-aged youth generally, discussed above,
20 JUUL made concerted efforts to market to students, including direct misstatements and omissions to
21 students on school grounds.
22

23 134. In January 2018, The Boulder Daily Camera published a front-page story about local
24 educators’ growing concerns over their students’ use of JUUL. Five days later, the principal at
25 Nederland Middle-Senior High School in Boulder, Colorado, Carrie Yantzer, received a surprising
26 email from someone introducing themselves as Bruce Harter, a former educator. Mr. Harter claimed he
27 was working with JUUL in developing anti-vaping curriculum for schools. Mr. Harter said he “read
28 about the challenges you’re having with JUUL” and offered a free, three-hour curriculum provided by

1 JUUL purportedly aimed at discouraging vaping amongst teens. Ms. Yantzer was not the only school
2 administrator to get such a letter.

3 135. During “educational” presentations to students like the one proposed to Ms. Yantzer,
4 representatives of JUUL not only sought to raise awareness of JUUL’s addictive products
5 surreptitiously, but JUUL also directly misrepresented or omitted the health risks associated with use of
6 JUUL products to students. For example:

- 8 • JUUL “was much safer than cigarettes and that “FDA would
9 approve it any day.”
- 10 • JUUL was “totally safe.”
- 11 • A student “...should mention JUUL to his [nicotine-addicted]
12 friend...because that’s a safe alternative than smoking cigarettes,
13 and it would be better for the kid to use.”
- 14 • “FDA was about to come out and say it [JUUL] was 99% safer
15 than cigarettes...and that...would happen very soon....”⁶²

16
17 136. In addition, JUUL contracted with organizations such as LifeSkills, Inc. (“LifeSkills”)
18 to purportedly provide health education to youth. In the instance of LifeSkills, the goal was to reach a
19 thousand youths in Baltimore, Maryland. JUUL’s relationship with LifeSkills included at least the
20 second half of 2018 and appears to have cost JUUL tens or hundreds of thousands of dollars. JUUL also
21 appears to have sponsored a summer camp for kids aged grades 3-12 put on by The Freedom &
22 Democracy Schools Foundation, Inc., in June 2018. In exchange for its payment of \$134,000, JUUL
23 would receive data, including the students’ general knowledge of health and risky behaviors, on the
24 camp’s participants.
25

26
27
28 ⁶² FDA News Release, *FDA warns JUUL Labs for marketing unauthorized modified risk tobacco products, including in outreach to youth* (Sep. 9, 2019), available at <https://www.fda.gov/news-events/press-announcements/fda-warns-juul-labs-marketing-unauthorized-modified-risk-tobacco-products-including-outreach-youth>.

1 137. JUUL’s “educational” programs were marketing events, plain and simple. JUUL
2 sought to raise awareness of its flavored, low-irritation nicotine products with students. Not surprisingly,
3 that very same tactic—purportedly educating youth about the dangers of a product in order to
4 surreptitiously market the product to them—was used by big tobacco in marketing traditional cigarettes.
5

6 **G. JUUL’S ILLEGAL CONDUCT GIVES RISE TO A YOUTH E-
7 CIGARETTE EPIDEMIC AND PUTS A GENERATION AT RISK**

8 138. Smoking remains the leading cause of preventable death in the U.S., killing more than
9 480,000 people a year. Each year, cigarette smoking causes about one in every five deaths in the U.S.

10 139. The FDA and CDC characterize teen vaping as an epidemic. In a September 11, 2018
11 statement announcing unprecedented steps to combat e-cigarette use by youth, FDA Commissioner Dr.
12 Scott Gottlieb observed: “[e]-cigs have become an almost ubiquitous – and dangerous – trend among
13 teens.” As to drivers of that epidemic, Dr. Gottlieb stated: “[w]e know that the flavors play an important
14 role in driving the youth appeal.” Dr. Gottlieb admonished JUUL and other e-cigarette manufacturers:
15 “I’ve been warning the e-cigarette industry for more than a year that they needed to do much more to
16 stem the youth trends. In my view, *they treated these issues like a public relations challenge* rather
17 than seriously considering their legal obligations, the public health mandate, and the existential threat to
18 these products.”
19

20 140. U.S. Surgeon General Vice Adm. Jerome M. Adams followed suit, issuing an advisory:
21 “stressing the importance of protecting children from a lifetime of nicotine addiction and associated
22 health risks by immediately addressing the epidemic of youth e-cigarette use.” The advisory notes the
23 appeal of flavored e-cigarettes to youth, as well as the harmful chemicals used to make certain of the
24 flavors. The Surgeon General singled out JUUL and its commanding market share, noting:
25

26 One of the most commonly sold USB flash drive shaped e-cigarettes is JUUL,
27 which experienced a 600% surge in sales during 2016-2017, giving it the greatest
28

1 market share of any e-cigarette in the U.S. by the end of 2017. ... All JUUL e-
2 cigarettes have a high level of nicotine. ... [JUUL's] products also use nicotine salts,
3 which allow particularly high levels of nicotine to be inhaled more easily and with less
4 irritation than the free-base nicotine that has traditionally been used in tobacco
5 products, including e-cigarettes. This is of particular concern for young people,
6 because it could make it easier for them to initiate the use of nicotine through these
7 products and also could make it easier to progress to regular e-cigarette use and
8 nicotine dependence. However, despite these risks, ***approximately two-third of JUUL***
9 ***users aged 15-24 do not know that JUUL always contains nicotine.*** (emphasis added)

10 141. According to a recent survey of adolescent drug use, 20.9% of 12th graders, 16.1% of
11 10th graders, and 6.1% percent of eighth graders had vaped nicotine in the previous 30 days.⁶³
12 According to the CDC, in 2018 3.05 million high-schoolers and 570,000 middle-schoolers used e-
13 cigarettes.⁶⁴ Those figures are up from 220,000 and 60,000 in 2011.⁶⁵ E-cigarette use increased 78%
14 among high-school students and 48% among middle-school students from 2017 to 2018.⁶⁶

15 142. A recent study out of the University of Michigan revealed: “[i]ncreases in adolescent
16 vaping from 2017 to 2018 were the largest ever recorded in 43 years for any adolescent substance use
17 outcome in the U.S.”⁶⁷ The study noted that the percentage of 12th graders who “reported ***vaping***
18 ***nicotine*** in the past 30 days nearly doubled, rising from 11% to 21%” between 2017 and 2018.⁶⁸ That
19 increase is “twice as large as the previous record for largest-ever increase among past 30-day outcomes
20 in 12th grade.”⁶⁹

23 ⁶³ Stein, *Teen Vaping Soared in 2018*, NPR (December 17, 2018), [https://www.npr.org/sections/health-](https://www.npr.org/sections/health-shots/2018/12/17/676494200/teen-vaping-soared-in-2018)

⁶⁹ *Id.*

1 143. Kentucky youth are no different. A 2018 Kentucky Incentives for Prevention survey
2 found that e-cigarette use had surpassed alcohol as the most widely used substance among young people
3 in Kentucky, and that there was a 66% increase in the use of e-cigarettes among 10th graders from 2017-
4 2018.⁷⁰ The use of e-cigarettes has nearly or more than doubled in students from 6th through 12th grade
5 from 2016 to 2018. The number of students who had used e-cigarettes in the last thirty days increased
6 from 2.3% to 4.25 in 6th graders, from 7.3% to 14.2% in 8th graders, from 11.3% to 23.2% in 10th graders,
7 and from 12.2% to 26.7% in 12th graders.⁷¹

8
9 144. The invasion of e-cigarettes and vaping products into Kentucky schools has swiftly
10 reversed a long-standing decline in the use of tobacco products among high school student. Traditional
11 cigarette use among 10th graders in Kentucky dropped more than 80% between 2000 and 2018. While
12 the rate of cigarette and smokeless tobacco use among Kentucky 10th graders has declined over the past
13 several years, E-cigarette use in the same age group has increased 200% from 2016 to 2018.

14
15 145. As a direct result of JUUL’s deceptive marketing and failure to warn of the harms
16 associated with e-cigarettes and nicotine, from 2015 to 2018, between only 14% to 18% of 12th graders
17 perceived using e-cigarettes regularly as posing great risk of harm.⁷² Those figures compared to a range
18 74% to 78% who saw great risk of harm from smoking one or more packs of traditional cigarettes per
19 day.⁷³ Similarly, an April 2018 study found: “63 percent of JUUL users did not know that the product
20 always contains nicotine.”⁷⁴

⁷⁴ Truth Initiative, *Data suggest teens who use JUUL are not just experimenting* (Nov. 1, 2018),
<https://truthinitiative.org/research-resources/emerging-tobacco-products/data-suggest-teens-who-use-juul-are-not-just> (last visited Sep. 12, 2019).

1 146. Based on the 2018 Kentucky Incentives for Prevention survey responses, Kentucky
2 youth “perceive little risk of harm with e-cigarette use.” They in fact perceive the “risk for vaping [as]
3 the lowest of all substances addressed on the KIP survey.”⁷⁵
4

5 147. CDC Director Dr. Robert R. Redfield expressed concern in a February 11, 2019
6 statement: “The skyrocketing growth of young people’s e-cigarette use over the past year threatens to
7 erase progress made reducing tobacco use. It’s putting a new generation at risk for nicotine addiction.”
8 Hundreds of vaping-related illnesses have been reported, with several deaths, including two deaths in
9 Kentucky. As Dr. Lee Norman, Secretary, Kentucky Department of Health and Environment, recently
10 testified: “I recognize this to be a public health emergency of considerable importance.”
11

12 **H. SCHOOLS ARE UNIQUELY AND DISPROPORTIONATELY HARMED BY**
13 **JUUL’S CONDUCT**

14 148. JUUL’s deceptive and illegal conduct has caused unique harm to Plaintiff. Because
15 Defendant targeted school-aged youth and even sought directly to raise awareness of their products on
16 school campuses through “education” presentations, schools like those in Plaintiff’s district are the
17 epicenter of the youth vaping epidemic.

18 149. An April 20, 2018 article in *The Wall Street Journal* titled “Schools and Parents Fight
19 JUUL E-Cigarette Epidemic,” described the problems parents and schools are facing with the meteoric
20 rise of nicotine use by America’s youth:
21

22 At Northern High School in Dillsburg, Pa., Principal Steve Lehman’s
23 locked safe, which once contained the occasional pack of confiscated cigarettes,
24 is now filled with around 40 devices that look like flash drives.
25

26
27 ⁷⁵ Kentucky Incentives for Prevention. 2018 State and Regional Data Report.
28 <https://static1.squarespace.com/static/5a30a0572aeba58c0fb5e2eb/t/5d17da6a7ada480001a07c14/1561844355466/KIP+State+%26+Regional+Trend+2018-29June2019.pdf%20> (last visited November 27, 2019).

1 and present, suspensions and absences may decrease the amount of funding a school receives. Similarly,
2 for those students addicted to JUUL, the per-student cost to educate is increased as schools take the
3 necessary actions to help addicted students quit JUUL’s highly- addictive nicotine products.

4 153. The highly-addictive nature of JUUL’s products will require years of expensive actions
5 by school districts to adequately address the epidemic. Indeed, it took decades and billions of dollars to
6 see a meaningful decline in cigarette use.

7
8 **I. JUUL HAS EXPERIENCED EXTRAORDINARY FINANCIAL**
9 **SUCCESS AT THE EXPENSE OF AMERICA’S YOUTH, PARENTS,**
10 **AND EDUCATORS**

11 154. With skyrocketing revenue gains, JUUL controls nearly three quarters of the e- cigarette
12 market. In 2017, JUUL’s revenues grew by an astounding 700% to \$200 million. JUUL’s 2018 revenue
13 continued to climb, hitting the \$1 billion mark. And despite growing restrictions and regulations in the
14 U.S., JUUL forecasts revenue of over \$3 billion for 2019.

15 155. In December 2018, Altria Group, Inc. (“Altria”), the parent of Phillip Morris USA, Inc.
16 (“Phillip Morris”) invested \$12.8 billion in JUUL, amounting to a 35% stake. Altria’s investment
17 translates to a \$38 billion valuation for JUUL.

18 156. Ironically, Altria’s announcement of its stake in JUUL came just weeks after Altria
19 announced it would remove its e-cigarette products from the market to purportedly address the youth
20 vaping epidemic.

21 157. In exchange for Altria agreeing to provide certain paid services to JUUL for at least six
22 years, Altria agreed to a non-competition obligation with JUUL. Altria and JUUL also entered into a
23 services agreement.

24 158. Under the agreements, Altria will, among other things, provide services to JUUL with
25 respect to logistics and distribution, access to retail shelf space, youth vaping “prevention,” cigarette
26 pack inserts and onserts, regulatory matters and government affairs. JUUL’s access to Altria’s retail
27
28

1 shelf space will allow JUUL products to appear alongside traditional cigarettes like Phillip Morris's
2 Marlboro brand, the country's most popular cigarette.

3 159. In addition, Philip Morris will send JUUL marketing messages to Phillip Morris's
4 database of traditional cigarette smokers' mailing and email addresses.

5 160. On a December 20, 2018 conference call, Altria's CEO Howard Willard said Altria was
6 "fortunate to be the tobacco company that's partnered up with JUUL" and that Altria's infrastructure,
7 including its "leading sales organization," would help accelerate JUUL's growth and financial
8 performance, to the benefit of both JUUL and Altria.

9 161. According to Dr. Jackler, the joining of JUUL and Marlboro brings together "the two
10 dominant players in the teenage nicotine addiction market, i.e., cigarettes and vaping. This powerful
11 combination constitutes a clear and present danger to youth."
12

13
14 **J. GOVERNMENT INVESTIGATIONS AND REGULATORY**
15 **ACTIONS SEEK TO HOLD JUUL ACCOUNTABLE AND COMBAT**
16 **THE TEEN JUUL EPIDEMIC**

17 162. In April 2018, the FDA announced that it was investigating JUUL's marketing efforts.
18 The FDA requested JUUL's research and marketing documents, including focus group data and
19 toxicology reports, and whether design features and ingredients appeal to specific age groups.

20 163. On September 12, 2018, the FDA sent letters to five e-cigarette manufacturers that
21 represent more than 97% of the current market. JUUL was among those manufacturers. Dr. Gottlieb
22 stated these companies are "now on notice by the FDA of how their products are being used by youth
23 at disturbing rates." The FDA also requested "the manufacturers of these brands and products to come
24 back to the FDA in 60 days with robust plans on how they'll convincingly address the widespread use
25 of their products by minors." Dr. Gottlieb ordered the companies to "demonstrate that they're truly
26 committed to keeping these [e-cigarettes] out of the hands of kids and they must find a way to reverse
27 this trend."
28

1 164. On September 31, 2018, the FDA conducted an unannounced inspection of JUUL’s
2 headquarters in San Francisco. The FDA sought more information about JUUL’s sales and marketing
3 practices.

4 165. In an October 25, 2018 public letter to the FDA, Altria’s Willard said “we share [the
5 FDA’s] concerns and ... are alarmed about the reported rise in youth e-vapor use to epidemic levels.”
6 *Altria admitted that “pod-based products significantly contribute to the rise in youth use of e-vapor*
7 *products.”*

8 166. In response to mounting criticism and pressure, in November 2018, JUUL stated it
9 “stopped accepting retail orders for our Mango, Fruit, Crème, and Cucumber JUUL pods to the over
10 90,000 retail stores that sell our product.” But JUUL continues selling those flavors on its website and
11 continues selling the highly-popular Mint flavor in retails stores. An April 2018 survey indicated that
12 JUUL’s “cool” mint flavor was the third-most popular flavor amongst JUUL users aged 12-17.⁷⁶

13 167. In June of 2019, San Francisco became the first major city to ban the sale and
14 distribution of e-cigarettes that have not undergone pre-market review by the FDA. JUUL’s e- cigarettes
15 have not undergone that review. San Francisco City Attorney Dennis Herrera said the ban is a step
16 toward preventing “another generation of San Francisco children from becoming addicted to nicotine.”

17 168. On July 24 and 25, 2019, the United States House of Representatives Committee on
18 Oversight and Reform held hearings at which JUUL executives and anti-tobacco witnesses testified.
19 The hearings sought to investigate “JUUL’s role in the youth nicotine addiction epidemic, marketing to
20 youth, misleading health claims, and new partnerships with traditional tobacco companies.” The
21 hearings included appearances from students and parents who testified that JUUL representatives spoke
22
23
24
25
26

27 ⁷⁶ Truth Initiative, *JUUL fails to remove all of youth’s favorite flavors from stores* (Nov. 15, 2018),
28 <https://truthinitiative.org/research-resources/emerging-tobacco-products/juul-fails-remove-all-youths-favorite-flavors-stores> (last visited Sept. 9, 2019).

1 at their schools, telling students that JUUL was “totally safe,” “much safer than cigarettes,” and that a
2 student “should mention JUUL to his [nicotine-addicted] friend” (discussed in greater detail below).

3 169. In August 2019, a *The Wall Street Journal* article titled “JUUL’s Marketing Under
4 Scrutiny As Vaping Increases Among Teens” revealed a Federal Trade Commission (“FTC”) probe into
5 JUUL’s use of “influencers and other marketing to appeal to minors” and whether “Juul engaged in
6 deceptive marketing.” The probe began before the agency’s antitrust review of Altria’s 35% stake in
7 JUUL, which Altria purchased in December 2018. The FTC is reportedly considering seeking monetary
8 damages.
9

10 170. A September 23, 2019, *The Wall Street Journal* article revealed that JUUL was the
11 subject of a federal criminal probe.
12

13 **K. THE FDA ISSUES A WARNING LETTER OUTLINING JUUL’S**
14 **DECEPTIVE MARKETING AND TARGETING OF SCHOOLS**

15 171. On September 9, 2019, the FDA issued a Warning Letter to JUUL ordering JUUL to
16 stop making unproven claims for its products. The FDA outlined violations of the Federal Food, Drug,
17 and Cosmetic Act by JUUL when JUUL advertised its e-cigarettes and nicotine juice as modified risk
18 tobacco products without an appropriate FDA Order in effect. The Warning Letter highlighted
19 statements JUUL made directly to students:
20

- 21 1. A JUUL representative speaking with students at his presentation
22 stated that JUUL “was much safer than cigarettes” and that “FDA
would approve it any day.”
- 23 2. The JUUL representative speaking with students at his presentation
24 called JUUL “totally safe.”
- 25 3. The JUUL representative speaking with students at his presentation
26 stated that a student “...should mention JUUL to his [nicotine-
27 addicted] friend...because that’s a safer alternative than smoking
cigarettes, and it would be better for the kid to use.”
- 28 4. The JUUL representative speaking with students at his presentation
stated, “FDA was about to come out and say it [JUUL] was 99%

1 safer than cigarettes...and that...would happen very soon....”

2
3 Referring to your ENDS products as “99% safer” than cigarettes, “much
4 safer” than cigarettes, “totally safe,” and “a safer alternative than smoking
5 cigarettes” is particularly concerning because these statements were made directly
6 to children in school. Our concern is amplified by the epidemic rate of increase in
7 youth use of ENDS products, including JUUL’s products, and evidence that ENDS
8 products contribute to youth use of, and addiction to, nicotine, to which youth are
9 especially vulnerable.

10
11 172. The FDA issued a separate letter to JUUL CEO Kevin Burns, requesting “documents
12 and information from JUUL Labs, Inc. regarding JUUL’s marketing, advertising, promotional, and
13 educational campaigns, as well as certain product development activity.” The FDA’s letter and news
14 release chided JUUL for its role in the youth vaping epidemic, noting “[s]ome of this youth use appears
15 to have been a direct result of JUUL’s *product design and promotional activities* and outreach efforts,”
16 in particular, its outreach efforts to students. The FDA’s September 9, 2019 letter highlighted specific
17 incidents of concerning “educational engagement and outreach,” requesting documents and explanations
18 regarding:
19

- 20 1. Ms. Meredith Berkman, Co-founder, Parents Against Vaping e-
21 cigarettes (PAVe), testified that, “In California, a retired school
22 superintendent was offering schools in his state and in Massachusetts
23 money if they would implement the anti-JUUL curriculum that...a man
24 named Bruce Harder was offering on JUUL’s behalf.”
- 25 2. On July 24, 2019, Dr. Robert Jackler, M.D., Professor at Stanford
26 University School of Medicine, testified that, “Altria may provide
27 services to JUUL with respect to...youth vaping prevention....”
- 28 3. On July 25, 2019, in response to questions from Chairman
Krishnamoorthi about JUUL’s program to pay schools \$10,000 or more
to use a JUUL youth prevention curriculum, Ms. Ashley Gould, Chief
Administrative Officer, JUUL Labs, Inc., testified:

1 “That is not currently the case. We ended that program in the
2 fall of 2018,” and that, “...there were six schools that received
3 funding from JUUL to implement programming to prevent teen
4 vaping....”

5
6 4. In addition, in response to questions from Chairman Krishnamoorthi
7 about internal JUUL correspondence in 2018 about setting up a booth
8 at a school health fair, Ms. Gould testified that JUUL ended its youth
9 prevention program.

10 5. In response to questions about JUUL’s agreement to pay the
11 Richmond, California Police Activities League (RPAL) \$89,000 to
12 use its youth prevention curriculum in the RPAL youth program,
13 which is for 12- to 17-year-olds who face suspension from school for
14 using e-cigarettes, Ms. Gould testified that JUUL ended its youth
15 prevention program.

16 6. Further, in response to questions about JUUL providing grants to
17 youth programs, such as a \$134,000 grant for a summer program at a
18 charter school in Baltimore, Maryland, for 80 students in grades 3 –
19 12, and for which the school agreed to provide JUUL with the
20 students’ data (e.g., surveys, journals, activity logs), Ms. Gould
21 testified that she, “...would have to check the contracts, but whatever
22 grants were made were focused on youth prevention efforts.”

23 7. Moreover, in response to questions about JUUL’s agreement with
24 Life Skills, Inc., to partner with church groups to provide health
25 education to a thousand youth in Baltimore, even though internal
26 JUUL correspondence indicated the company was aware that tobacco
27 companies promoted such initiatives in the 1990s, Ms. Gould again
28 testified that JUUL ended its youth prevention program.

8. In addition, in response to questions about JUUL’s contract with a
consulting group to promote cessation programs run by community-
based groups, including veterans’ organizations, Ms. Gould testified
that she would need to review the documents being referenced.

173. In a statement issued the same day, Acting FDA Commissioner Dr. Norman Sharpless
put it bluntly: JUUL has “*ignored the law, and very concerningly, has made some of these statements
in school to our nation’s youth.*”

1 **V. EFFECTS ON PLAINTIFF MENIFEE COUNTY PUBLIC SCHOOLS**

2
3 174. While the length of time and steps ultimately necessary to address fully the epidemic
4 of student vaping in Plaintiff’s district are not yet know due to the magnitude and uniqueness of the
5 problem, Plaintiff has already expended, and is expending, significant resources combatting the
6 problem.

7 175. Plaintiff and its administrative staff have expended substantial institutional energy,
8 resources, and money in the monitoring, educating and disciplining of students as a result of the
9 significant increase in vaping in school.

10
11 176. Plaintiff and its administrative staff have expended substantial institutional energy,
12 resources, and money as a result of increased suspensions which require alternative arrangements for
13 continued education of students and arranging for educational courses pertaining to the use of e-
14 cigarettes.

15 177. Plaintiff and its security staff have expended substantial institutional energy, resources
16 and money in policing school property to protect against the harmful effects of vaping and to ensure a
17 safe educational environment for students.

18
19 **VI. CAUSES OF ACTION**

20 **Count I**
21 **Violation of the Racketeer Influenced Corrupt**
22 **Organizations (“RICO”) Act § 1962(a), (c) & (d)**

23 178. Plaintiff incorporates by reference all preceding paragraphs.

24 179. Defendant is a “person” under 18 U.S.C. §1961(3).

25
26 180. Section 1962(a) makes it “unlawful for any person who has received any income
27 derived, directly or indirectly, from a pattern of racketeering activity or through collection of an unlawful
28 debt in which such person has participated as a principal within the meaning of Section 2, Title 18,

1 United States Code, to use or invest, directly or indirectly, any part of such income, or the proceeds of
2 such income, in acquisition of any interest in, or the establishment or operation of, any enterprise which
3 is engaged in, or the activities of which affect, interstate or foreign commerce.” 18 U.S.C. § 1962(a).

4 181. Section 1962(c) makes it “unlawful for any person employed by or associated with any
5 enterprise engaged in, or the activities of which affect, interstate or foreign commerce, to conduct or
6 participate, directly or indirectly, in the conduct of such enterprise’s affairs through a pattern of
7 racketeering activity.” 18 U.S.C. § 1962(c).

8 182. Section 1962(d) makes it unlawful for “any person to conspire to violate” §§ 1962(a)
9 and (c), among other provisions. 18 U.S.C. § 1962(d).

10 183. The enterprise, the activities of which affected interstate and foreign commerce, was
11 comprised of an association in fact of persons consisting of JUUL, Cult Collective, Grit, Impact Tech,
12 Inc. (“Impact Tech”), LifeSkills, the Social Media Influencers, the JUUL Affiliates, JUUL product
13 manufacturers, JUUL distributors, and JUUL retailers (collectively, the “JUUL Youth Marketing
14 Enterprise”).

15 184. Cult Collective is a marketing agency headquartered in Calgary, Alberta.

16 185. Grit is a marketing agency incorporated in Kentucky and headquartered in Frankfort,
17 Kentucky.

18 186. Impact Tech is an advertising and affiliate marketing company whose self- described
19 mission is “to deliver disruptive innovations in technology to help our clients successfully navigate the
20 ever-changing, digital landscape and grow their business.” Impact Tech maintains U.S. offices in New
21 York, California, Ohio, and Washington.

22 187. JUUL, in concert with Impact Tech, utilized the deceptive affiliate program, described
23 above, whereby purportedly independent entities—the JUUL Affiliates—were to promote JUUL
24 products and steer would-be consumers to JUUL’s web site. The JUUL Affiliates were compensated for
25
26
27
28

1 their services, as was Impact Tech for facilitating JUUL’s affiliate program. JUUL expressly directed
2 the JUUL Affiliates to not disclose their affiliation with JUUL.

3 188. LifeSkills is a consulting group with whom JUUL contracted to purportedly provide
4 health education to a thousand youth in Baltimore, Maryland. As discussed herein, JUUL’s “education”
5 programs directed at youth, and schools in particular, were marketing programs designed to
6 surreptitiously promote and encourage JUUL use.
7

8 189. The JUUL Youth Marketing Enterprise functions to achieve a shared purpose: a scheme
9 to deceive youth regarding the health risks and characteristics of JUUL e-cigarettes and JUULpods to
10 encourage youth use of JUUL products, to enable use of JUUL products on school premises and during
11 class, to downplay or conceal the dangers posed by nicotine use, to design a product that facilitated
12 youth e-cigarette use and initiation of use by non-smokers, to conceal the unparalleled potency of
13 JUUL’s e-cigarette, to addict youth to JUUL products, to gain financially, through unlawful means.
14

15 190. JUUL misstated and omitted material facts in social media posts—both its own posts
16 and posts of its Social Media Influencers, advertisements on JUUL’s website, email messages, print
17 materials including 2015 full-page ads in *Vice* magazine, point-of-sale advertising, free JUUL
18 distribution events, “education” programs to schools and youth, and product packaging.
19

20 191. The JUUL Youth Marketing Enterprise misrepresented or failed to adequately disclose
21 that its products contained nicotine or how much nicotine JUUL products deliver to a user’s
22 bloodstream, including as compared to a combustible cigarette, as well as the benzoic acid levels
23 JUULpods contain. JUUL further omitted the increased risk of addiction, physiological effects, and
24 other severe health risks the higher-than-disclosed levels of nicotine delivery pose to a JUUL user.
25 Instead, JUUL intentionally created a misleading impression that JUUL’s products were intended for
26 youth, were totally safe or at least safer than combustible cigarettes, and were not a nicotine delivery
27 device but, rather, a trendy tech product that should be associated with products like the wildly popular
28 iPhone.

1 192. The JUUL Youth Marketing Enterprise violated the Federal Food, Drug, and Cosmetic
2 Act, 21 U.S.C. §§ 387b(8), 387k(a), as amended by the Tobacco Control Act, by advertising its e-
3 cigarettes and nicotine juice as modified risk tobacco products without an appropriate FDA Order in
4 effect, *i.e.* widely disseminating misleading statements about the safety of JUUL products.
5

6 193. These deceptive acts were taken with the express intent of growing JUUL's market
7 share and increasing JUUL's revenue, thereby causing financial gain to each of the JUUL Youth
8 Marketing Enterprise's constituents. In addition to enhancing the fortunes of its members, some of the
9 increased revenues were used to operate and expand the JUUL Youth Marketing Enterprise.

10 194. Each member of the JUUL Youth Marketing Enterprise was associated with an illegal
11 enterprise, and conspired, conducted, and participated in that enterprise's affairs, through a pattern of
12 racketeering activity consisting of numerous and repeated uses of the interstate mail and wire facilities
13 to execute a scheme to defraud, in violation of 18 U.S.C. §§ 1341 and 1343, all in violation of the RICO
14 Act, 18 U.S.C. §§1962(a), (c)-(d). These acts, committed by interstate wire and through the mails,
15 include: (1) sending and receiving thousands of statements over a number of years that contained
16 deceptive statements regarding JUUL's e-cigarettes and JUULpods, the effects of nicotine use, the
17 likelihood of becoming addicted to nicotine use, the design of JUUL's e-cigarettes, the amount of
18 nicotine and other chemicals in JUULpods, and that JUUL's e-cigarettes were intended for use by adults
19 who were already addicted to nicotine use rather than by teens who were new nicotine users; and (2)
20 sending payments over that same time to further and guarantee the success of the deceptive acts
21 described in (1).
22

23 195. Each member of the JUUL Youth Marketing Enterprise profited from the enterprise,
24 and Plaintiff suffered injury to its property because it has incurred substantial expense, is incurring
25 substantial expense, and will continue to incur substantial expense in mitigating and combatting the
26 harmful effects resulting from JUUL use by students, including increased security and monitoring
27 protocols, student suspensions and other disciplinary programs, and educational programs necessary to
28

1 correct the JUUL Youth Marketing Enterprise's deceptive and illegal marketing. The members of the
2 JUUL Youth Marketing Enterprise used the proceeds from their deceptive acts to further the scheme by,
3 among other things, expanding the depth and breadth of the deceptive marketing. For example, JUUL
4 began offering to sponsor purportedly education-related activities under the guise of preventing
5 underage use of e-cigarettes. In reality, JUUL sought to raise awareness of its products and gain
6 additional student users.
7

8 196. The members of the JUUL Youth Marketing Enterprise conspired to deceive Plaintiff.

9 197. The JUUL Youth Marketing Enterprise has existed since at least 2015. It has functioned
10 as a continuing unit and maintains an ascertainable structure separate and distinct from the pattern of
11 racketeering activity. Each member's participation in the JUUL Youth Marketing Enterprise is necessary
12 for the successful operation of the deceptive marketing scheme and the financial gains that resulted
13 therefrom.
14

15 198. Plaintiff has sustained injury to its property by reason of the acts and conduct of
16 Defendant alleged in this Complaint, including their loss of money in funding mitigation and remedial
17 programs regarding JUUL use by students which but for the deceptive marketing and other acts of the
18 JUUL Youth Marketing Enterprise, it would not have incurred.

19 199. Plaintiff was the direct target of Defendant's scheme.
20

21 200. But for the conduct of Defendant alleged herein, Plaintiff would not have been injured.
22 The injury suffered by Plaintiff was a foreseeable and natural consequence of the scheme to defraud.

23 201. The injuries of Plaintiff were directly and proximately caused by Defendant's
24 racketeering activity that deceived and defrauded consumers and resulted in a meteoric rise of youth-
25 vaping.
26

27 202. As a result, and by reason of the foregoing, Plaintiff has been injured, suffered harm
28 and sustained damage to its business and property, and is therefore entitled to recover actual and treble

1 damages, and its costs of suit, including reasonable attorney fees, pursuant to 18

2 U.S.C. § 1964(c).

3
4 203. In addition, as set forth above, Defendant has violated 18 U.S.C. §§ 1962 (c), and (d),
5 and will continue to do so in the future.

6 204. Enjoining Defendant from committing these RICO violations in the future and/or
7 declaring their invalidity and disgorging ill-gotten gains is appropriate pursuant to 18 U.S.C. § 1964(a),
8 which authorizes the district courts to issue appropriate orders to provide equitable relief to civil RICO
9 plaintiffs and enjoin violations of 18 U.S.C. § 1962.

10
11 205. Plaintiff seeks compensatory damages, disgorgement, equitable relief, injunctive relief,
12 treble damages, and attorneys' fees.

13 **VIII. COUNT II PUBLIC NUISANCE**

14 206. Plaintiff incorporates by reference all preceding paragraphs.

15
16 207. JUUL created and maintained a public nuisance which proximately caused injury to
17 Plaintiff.

18 208. Defendant's design, manufacture, production, marketing, distribution, and sale of
19 highly-addictive and harmful e-cigarettes and nicotine juice pods, when such actions were taken with
20 the intent to market and, in fact, were marketed to youth through repeated misstatements and omissions
21 of material fact, unreasonably interfered with a public right in that the results of Defendant's actions
22 created and maintained a condition dangerous to the public's health, was offensive to community moral
23 standards, or unlawfully obstructed the public in free use of public property. Defendant intentionally
24 created and maintained a public nuisance by, among other acts:
25

- 26
27 a. designing a product that was uniquely youth-oriented in design,
28 resembling a common USB flash drive;

- b. designing a product that was meant to facilitate underage use, both generally and by enabling easy concealment of Defendant's e-cigarette in school;
- c. designing a product with a nicotine delivery system that results in a quicker and more potent dose of nicotine to its users;
- d. designing a product with as little irritation to a user's throat, like that experienced from smoking a combustible cigarette, as possible to facilitate initiation of nicotine use by youth and non-smokers;
- e. designing a flavored nicotine juice for its e-cigarette that was intended to mask the harmful effects of nicotine and facilitate initiation of nicotine use by youth and non-smokers;
- f. marketing highly-addictive nicotine products to youth, who are, because of their age and lack of experience, particularly susceptible to Defendant's targeted marketing preying on their need for social acceptance;
- g. marketing a nicotine product to a population—youth—that, because of their developmental stage, is more susceptible to nicotine addiction;
- h. marketing nicotine products to a population—youth—that faces an increased risk of adverse mental and physical health impacts from nicotine use; and
- i. misrepresenting, in marketing and elsewhere, the actual amount of nicotine that its product contains and delivers, as well as misrepresenting the amount of benzoic acid and other chemicals Defendant's nicotine juice contains.

209. Defendant's acts described throughout this Complaint and in the preceding paragraph were continuous and occurred over a span of several years and, in fact, in large part are continuing to occur.

210. The public nuisance created and maintained by Defendant's wrongful acts inundated Plaintiff's schools, in that the nuisance created was in close proximity to Plaintiff. The nuisance created and maintained by Defendant has resulted in an epidemic of nicotine use by students, as well as

1 significant expenditures—past, present, and future—by Plaintiff to combat the epidemic. Indeed, as
2 discussed herein, Defendant and agents thereof presented directly to students at schools and through
3 youth programs and community events, in addition to the youth-oriented design and marketing of
4 Defendant’s nicotine products.

5
6 211. The public nuisance created and maintained by Defendant has resulted, and continues
7 to result, in significant damage and annoyance to Plaintiff. Again, the FDA and others have recognized
8 that teen vaping is an epidemic and that Defendant’s actions are at the heart of that epidemic.

9
10 212. The injury suffered by Plaintiff is distinguishable from that suffered by the general
11 public, both in kind and quality. Plaintiff, a school district, has incurred, and continues to incur,
12 significant expenditures of time and resources to combat rampant use of Defendant’s nicotine products
13 by students, including during school. The significant time and resources necessary to combat this reality
14 and maintain the safety of Plaintiff’s students and achieve the educational goals of Plaintiff are unique
15 from the harm suffered by the general public.

16 **IX. COUNT III NEGLIGENCE**

17 213. Plaintiff incorporates by reference all preceding paragraphs.

18
19 214. Defendant owed Plaintiff a duty to not expose Plaintiff to an unreasonable risk of
20 harm.

21 215. At all times relevant to this litigation, Defendant had a duty to exercise reasonable care
22 in the design, research, manufacture, marketing, advertisement, supply, promotion, packaging, sale,
23 and distribution of their JUUL products, including the duty to take all reasonable steps necessary to
24 manufacture, promote, and/or sell a product that was not unreasonably dangerous to consumers, users,
25 and other persons coming into contact with the product.

26
27 216. At all times relevant to this litigation, Defendant had a duty to exercise reasonable care
28 in the marketing, advertisement, and sale of their JUUL products. Defendant’s duty of care owed to

1 consumers and the general public, including Plaintiff, included providing accurate, true, and correct
2 information concerning the risks of using JUUL products and appropriate, complete, and accurate
3 warnings concerning the potential adverse effects of vaping and nicotine use and, in particular, JUUL's
4 patented nicotine salts and the chemical makeup of JUULpods liquids.
5

6 217. At all times relevant to this litigation, Defendant knew or, in the exercise of reasonable
7 care, should have known of the hazards and dangers of JUUL products and specifically, the health
8 hazards posed by vaping JUULpods and continued use of nicotine, particularly among adolescents.

9 218. Accordingly, at all times relevant to this litigation, Defendant knew or, in the exercise
10 of reasonable care, should have known that use of JUUL e-cigarettes and JUULpods by students could
11 cause Plaintiff's injuries and thus created a dangerous and unreasonable risk of injury to Plaintiff.
12

13 219. Defendant also knew or, in the exercise of reasonable care, should have known that users
14 and consumers of JUUL products were unaware of the risks and the magnitude of the risks associated
15 with the use of JUUL products including but not limited to the risk of continued nicotine use and nicotine
16 addiction.

17 220. As such, Defendant breached their duty of reasonable care and failed to exercise
18 ordinary care in the design, research, development, manufacture, testing, marketing, supply, promotion,
19 advertisement, packaging, sale, and distribution of their JUUL e-cigarettes and JUULpods, in that
20 Defendant manufactured and produced defective products containing nicotine and other chemicals
21 known to cause harm to consumers, knew or had reason to know of the defects inherent in its products,
22 knew or had reason to know that a user's or consumer's use of the products created a significant risk
23 of harm and unreasonably dangerous side effects, and failed to prevent or adequately warn of these
24 risks and injuries.
25

26 221. Despite their ability and means to investigate, study, and test its products and to provide
27 adequate warnings, Defendant has failed to do so. Indeed, Defendant has wrongfully concealed
28

1 information and has further made false and/or misleading statements concerning the safety and/or use of
2 JUUL products and nicotine vaping.

3 222. Defendant's negligence included:
4

- 5 a. Manufacturing, producing, promoting, formulating, creating, developing,
6 designing, selling, and/or distributing its JUUL products without
7 thorough and adequate pre- and post-market testing;
- 8 b. Failing to undertake sufficient studies and conduct necessary tests to
9 determine whether or not JUUL products were safe for their intended
10 use;
- 11 c. Failing to use reasonable and prudent care in the design, research,
12 manufacture, formulation, and development of JUUL products so as to
13 avoid the risk of serious harm associated with the prevalent use of
14 JUUL products and nicotine;
- 15 d. Failing to provide adequate instructions, guidelines, and safety
16 precautions to those persons who Defendant could reasonably
17 foresee would use their JUUL products;
- 18 e. Failing to disclose to Plaintiff, users, consumers, and the general public
19 that the use of JUUL products presented severe health risks including
20 nicotine addiction;
- 21 f. Representing that its JUUL products were safe for their intended use
22 when, in fact, Defendant knew or should have known that the products
23 were not safe for their intended use;
- 24 g. Declining to make or propose any changes to JUUL products' labeling or
25 other promotional materials that would alert the consumers and the
26 general public of the true risks of JUUL products;
- 27 h. Advertising, marketing, and recommending the use of JUUL products,
28 while concealing and failing to disclose or warn of the dangers known
or implied by Defendant to be associated with or caused by the use of JUUL
products;
- i. Continuing to disseminate information to its consumers, which indicates
or implies that Defendant's products are not unsafe for their intended

1 use; and

2
3 j. Continuing the manufacture and sale of its products with the knowledge
4 that the products were unreasonably unsafe and dangerous.

5 223. Defendant knew and/or should have known that it was foreseeable that Plaintiff would
6 suffer injuries as a result of Defendant's failure to exercise ordinary care in the manufacturing,
7 marketing, labeling, distribution, and sale of JUUL products.

8 224. Plaintiff did not know the nature and extent of the injuries that could result from the
9 intended use of JUUL products or JUUL's patented JUULpods liquids by Plaintiff's students.
10

11 225. Defendant's negligence was the proximate cause of the injuries, harm, and economic
12 losses that Plaintiff suffered, and will continue to suffer, as described herein.

13 226. Defendant's conduct, as described above, was reckless. Defendant regularly risks the
14 lives of consumers and users of its products with full knowledge of the dangers of its products.
15 Defendant made conscious decisions not to redesign, re-label, warn, or inform the unsuspecting public,
16 including Plaintiff. Defendant's reckless conduct therefore warrants an award of aggravated or punitive
17 damages.
18

19 227. As a proximate result of Defendant's wrongful acts and omissions in placing its
20 defective JUUL products into the stream of commerce without adequate warnings of their hazardous
21 nature, Plaintiff has been injured and suffered economic damages and will continue to incur expenses
22 in the future.

23 **X. COUNT IV GROSS NEGLIGENCE**

24 228. Plaintiff incorporates by reference all preceding paragraphs.

25 229. Defendant owed a duty of care to Plaintiff to conduct their business of manufacturing,
26 promoting, marketing, and/or distributing JUUL nicotine products in compliance with applicable state
27 law and in an appropriate manner.
28

1 230. Specifically, Defendant had a duty and owed a duty to Plaintiff to exercise a degree of
2 reasonable care including, but not limited to: ensuring that JUUL marketing does not target minors;
3 ensuring that JUUL e-cigarettes and JUULpods are not sold and/or distributed to minors and are not
4 designed in a manner that makes them unduly attractive to minors; designing a product that is not
5 defective and unreasonably dangerous; designing a product that will not addict youth or other users to
6 nicotine; adequately warning of any reasonably foreseeable adverse events with respect to using the
7 product. Defendant designed, produced, manufactured, assembled, packaged, labeled, advertised,
8 promoted, marketed, sold, supplied and/or otherwise placed JUUL products into the stream of
9 commerce, and therefore owed a duty of reasonable care to those, including Plaintiff, who would be
10 impacted by its use.
11

12 231. JUUL's products were the types of products that could endanger others if negligently
13 made, promoted, or distributed. Defendant knew the risks that young people would be attracted to their
14 e-cigarettes and JUULpods and knew or should have known the importance of ensuring that the products
15 were not sold and/or distributed to anyone under age 26, but especially to minors.
16

17 232. Defendant knew or should have known that their marketing, distribution, and sales
18 practices did not adequately safeguard minors from the sale and/or distribution of e-cigarette devices
19 and JUULpods and, in fact, induced minors to purchase JUUL products.
20

21 233. Defendant was negligent in designing, manufacturing, supplying, distributing,
22 inspecting, testing (or not testing), marketing, promoting, advertising, packaging, and/or labeling
23 JUUL's products.

24 234. As a powerfully addictive and dangerous nicotine-delivery device, Defendant knew or
25 should have known that JUUL's products needed to be researched, tested, designed, advertised,
26 marketed, promoted, produced, packaged, labeled, manufactured, inspected, sold, supplied and
27 distributed properly, without defects and with due care to avoid needlessly causing harm. Defendant
28

1 knew or should have known that their products could cause serious risk of harm, particularly to young
2 persons like students in Plaintiff's schools.

3 235. Defendant was negligent, reckless and careless and failed to take the care and duty owed
4 to Plaintiff, thereby causing Plaintiff to suffer harm.
5

6 236. The negligence and extreme carelessness of Defendant includes, but is not limited to,
7 the following:

- 8 a. Failure to perform adequate testing of the JUUL products prior to
9 marketing to ensure safety, including long-term testing of the product,
10 and testing for injury to the brain and cardiovascular systems, and other
11 related medical conditions;
- 12 b. Failure to take reasonable care in the design of JUUL's products;
- 13 c. Failure to use reasonable care in the production of JUUL's products;
- 14 d. Failure to use reasonable care in the manufacture of JUUL's products;
- 15 e. Failure to use reasonable care in the assembly of JUUL's products;
- 16 f. Failure to use reasonable care in supplying JUUL's products;
- 17 g. Failure to use reasonable care in distributing JUUL's products;
- 18 h. Failure to use reasonable care in advertising, promoting, and
19 marketing JUUL's products;
- 20 i. Promotion of JUUL's products to young people under age 26,
21 and especially to minors;
- 22 j. Use of flavors and design to appeal to young people under age 26,
23 and especially to minors, in that the products smell good, look cool
24 and are easy to conceal from parents and teachers;
25
26
27
28

- 1 k. Use of design that maximizes nicotine delivery while minimizing
2 “throat hit,” thereby easily creating and sustaining addiction;
- 3 l. Failure to prevent JUUL’s products from being sold to young
4 people under age 26, particularly to minors;
- 5 m. Failure to prevent use of JUUL’s products among young people under
6 age 26, particularly for minors;
- 7 n. Failure to curb use of JUUL’s products among young people under age
8 26, particularly for minors;
- 9 o. Failure to develop tools or support to help people addicted to JUUL’s
10 products cease using the products, including manufacturing lesser
11 amounts of nicotine;
- 12 p. Failure to reasonably and properly test and properly analyze the
13 testing of JUUL’s products under reasonably foreseeable
14 circumstances;
- 15 q. Failure to warn its customers about the dangers associated with use of
16 JUUL’s products, in that it was unsafe for anyone under age 26,
17 significantly increases blood pressure, carries risks of stroke, heart
18 attacks, and cardiovascular events, is powerfully addictive, can cause
19 permanent brain changes, mood disorders, and impairment of thinking
20 and cognition.
- 21 r. Failure to instruct customers not to use the product if they were under
22 26, particularly minors, and failing to provide any instructions
23 regarding a safe amount of JUULpods to consume in a day.
- 24 s. Failure to ensure that JUUL’s products would not be used by persons
25 like Plaintiff’s students who were not smokers and who were under
26 age 26, particularly minors;
- 27 t. Failure to warn customers that JUUL had not adequately tested or
28 researched JUUL products prior to marketing to ensure safety,
including long-term testing of the product, and testing for injury to
the brain and cardiovascular systems, and other related medical
conditions;
- u. Failure to utilize proper materials and components in the design
of JUUL’s products to ensure they would not deliver unsafe

1 doses of nicotine;

2
3 v. Failure to use due care under the circumstances;

4 w. Failure to take necessary steps to modify JUUL's products to avoid
5 delivering high doses of nicotine to young people and repeatedly
6 exposing them to toxic chemicals;

7 x. Failure to recall JUUL's products; and

8
9 y. Failure to inspect JUUL's products for them to operate properly and
avoid delivering unsafe levels of nicotine to young persons.

10
11 237. Defendant breached the duties they owed to Plaintiff and in doing so, were wholly
12 unreasonable. A responsible company, whose primary purpose is to help adult smokers, would not
13 design a product to appeal to minors and nonsmokers nor market their products to minors and
14 nonsmokers. If they are aware of the dangers of smoking and nicotine ingestion enough to create a
15 device to help people stop smoking, then they are aware of the dangers enough to know that it would be
16 harmful for young people and nonsmokers to use.

17
18 238. Defendant breached their duties through their false and misleading statements and
19 omissions in the course of its manufacture, distribution, sale, and/or marketing of JUUL nicotine
20 products within the State.

21
22 239. As a foreseeable consequence of Defendant's breaches of its duties, Plaintiff suffered
23 direct and consequential economic injuries as a result of dealing with the JUUL epidemic in Plaintiff's
24 schools.

25
26 240. Defendant's breaches of their duties involved an indifference to duty amounting to
recklessness and actions outside the bounds of reason, so as to constitute gross negligence.

27
28 241. Defendant's gross negligence was egregious, directed at the public generally, and
involved a high degree of moral culpability.

XI. COUNT V PUNITIVE DAMAGES

242. Plaintiff incorporates by reference all preceding paragraphs.

243. Defendant was grossly negligent in that Defendant committed intentional acts of an unreasonable character in disregard of known or obvious risks so great as to make it highly probably that harm would result in the course of their manufacture, distribution, sale, promotion, advertising and/or marketing of JUUL products within the State.

244. Defendant knew the risks that minors would be attracted to their e-cigarettes and JUULpods and knew or should have known the importance of ensuring that the products were not sold and/or distributed to minors and young people.

245. Defendant could have easily marketed the products to a whole different audience of prior smokers as well as could have easily informed the ultimate consumers of the extremely high nicotine content, the true level of which Defendant fraudulently misrepresented and concealed.

246. Defendant intentionally and willfully breached the duties they owed to Plaintiff and in doing so, were wholly unreasonable. Defendant breached their heightened duties owed to minors when they oppressively and intentionally marketed and sold JUUL products to minors, which they should not have done.

247. Defendant's acts and omissions constitute gross negligence and wanton and willful conduct, because they constitute a total lack of care and an extreme departure from what a reasonably careful person or a reasonably careful company that holds itself out as manufacturers of smoking cessation devices would do in the same situation to prevent foreseeable harm to young persons

248. Defendant intentionally misrepresented, deceived, and/or concealed material facts known to Defendant regarding the nature of the JUUL and the risks associated therewith. Defendant took these actions with the intention of causing minors to use and become addicted to JUUL, including use of the JUUL device on school grounds.

1 mental and physical health from use of Defendant's products, including high-levels of nicotine exposure
2 and nicotine addiction.

3 258. In all forms of advertising, including but not limited to social media communications,
4 Defendant failed to warn adequately or instruct foreseeable users, including youth and adolescent users,
5 that JUUL products were unreasonably dangerous to them and created a high level of risk of harm caused
6 by vaping JUULpods, including but not limited to nicotine exposure and addiction. Defendant failed to
7 warn adequately in their advertising or anywhere on the product that the product was not safe for minors
8 and, instead, posed serious immediate and long-term health risks, and should not be used or consumed by
9 them. Rather, Defendant intentionally marketed their products to minors in youth-friendly colors and
10 flavors. Defendant also designed their products to be more palatable to youth and nonsmokers by making
11 JUUL e-cigarettes easier to inhale while increasing the level of nicotine that is absorbed by users, making
12 them even more addictive.

13
14
15 259. The defects in JUUL's products, including the lack of warnings or instructions, existed
16 at the time the JUUL e-cigarettes and JUULpods were sold and/or when the JUUL e- cigarettes and
17 JUULpods left JUUL's possession or control.

18 260. JUUL's e-cigarettes and JUULpods were anticipated to be used by youth, including
19 students, without substantial change in their condition from the time of their manufacture or sale.

20
21 261. Plaintiff was harmed directly and proximately by Defendant's failure to warn. Such
22 harm includes significant and ongoing nicotine abuse and addiction by students at Plaintiff's schools,
23 which has necessitated and continues to necessitate significant steps to combat and mitigate use of
24 Defendant's products by students. Use of Defendant's products by students at Plaintiff's schools
25 frustrates Plaintiff's ability to achieve its educational goals and ensure the safety of Plaintiff's students
26 which, again, has required and continues to require significant expenditures of Plaintiff's resources to
27 address these conditions.

28

XIII. COUNT VII

Strict Product Liability – Design Defect

1
2
3 262. Plaintiff incorporates by reference all preceding paragraphs.

4 263. Defendant designed, engineered, developed, manufactured, fabricated, assembled,
5 equipped, tested or failed to test, inspected or failed to inspect, labeled, advertised, promoted, marketed,
6 supplied, distributed, wholesaled, and sold the JUUL e-cigarettes and JUULpods, which were intended
7 by Defendant to be used as a method of vaping nicotine and the other aerosolized constituents of JUUL’s
8 nicotine solution.
9

10 264. Defendant knew or, by the exercise of reasonable care, should have known that JUUL’s
11 products under ordinary use were harmful or injurious, particularly to youths and adolescents, including
12 students at Plaintiff’s schools.
13

14 265. As described herein, Defendant designed and marketed their products to appeal to
15 nonsmokers, youths and adolescents and to encourage them to buy and use the product. Because JUUL
16 products deliver significantly more nicotine into a user’s bloodstream than combustible cigarettes and
17 contain more nicotine than JUUL represents, thereby posing an unnecessary risk of addiction and other
18 severe health consequences, they are inherently defective. In addition, because JUUL products are made
19 to create and sustain addiction, including through a quicker and more potent delivery system than
20 Defendant represented and compared to any other nicotine vaping product, they are unreasonably
21 dangerous and defective in design. The risks inherent in the design of JUUL products outweigh
22 significantly any benefits of such design, including any benefit as an alternative to smoking combustible
23 cigarettes.
24

25 266. At all relevant times, Defendant could have employed reasonably feasible alternative
26 designs to prevent the harms discussed herein.
27
28

1 RESPECTFULLY SUBMITTED this 21st day of July, 2020.
